# Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://webapp.etsi.org/IPR/home.asp).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

# Foreword

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under www.etsi.org/key .

# Contents

# Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

# 1 Scope

This document specifies the stage 1 requirements for realisation of an Open Service Access (OSA).

OSA enables applications to make use of network functionality through an open standardised interface (the OSA API). OSA provides the glue between applications and network functionality. In this way applications implementing the services become independent from the underlying network technology.

Applications which make use of network functionality offered through the OSA interface are not standardised by 3GPP.

OSA is one toolkit, amongst others, that enables certain aspects of the requirements of the Virtual Home Environment (VHE) concept to be realised.

This document is only applicable to OSA release 4. In Release 99 Service requirements are described in the VHE stage 1 description [1].

# 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

# 3 Definitions and abbreviations

## 3.1 Definitions

For the purposes of the present document, the following terms and definitions apply:

**Applications:** software components providing services to users by utilising service capability features.

**Application Interface:** standardised Interface used by applications to access service capability features.

**Call:** A logical association between several users (this could be connection oriented or connection less).

**Charging:** A function whereby information related to a chargeable event is formatted and transferred in order to make it possible to determine usage for which the charged party may be billed.

**HE-VASP:** Home Environment Value Added Service Provider. For the definition see [1]

**Home Environment:** For the definition see [1]

**Local Service:** For the definition see [1]

**Personal Service Environment:** For the definition see [1]

**Service Capabilities:** bearers defined by parameters, and/or mechanisms needed to realise services. These are within networks and under network control.

**Service Capability Feature:** functionality offered by service capabilities that are accessible via the standardised application interface.

**Service Provider:** an organisation which delivers services to the subscriber. This can be e.g. the operator of the subscriber's Home Environment or an authorised VASP.
Note: In the context of this specification it is assumed, that at least one application providing the services of the Service Provider makes use of OSA functions

**Services:** a service is the user experience provided by one or more applications.

**User:** For the definition see [1]

**Virtual Home Environment:** For the definition see [1]

Further 3G related definitions are given in 3G TS 21.905 [3].

## 3.2 Abbreviations

For the purposes of this TS the following abbreviations apply:

| | |
|---|---|
| API | Application Programming Interface |
| CAMEL | Customised Application For Mobile Network Enhanced Logic |
| HE | Home Environment |
| PSE | Personal Service Environment |
| VHE | Virtual Home Environment |
| OSA | Open Service Access |
| SCF | Service Capability Feature |
| MExE | Mobile Execution Environment |

Further 3G related abbreviations are given in 3G TS 21.905 [3].

# 4 General Description of OSA

In order to be able to implement future applications/end user services that are not yet known today, a highly flexible Framework for Services [1] is required. The Open Service Access (OSA) enables applications implementing the services to make use of network functionality. Network functionality offered to applications is defined in terms of a set of Service Capability Features (SCFs). These SCFs provide functionality of network capabilities which is accessible to applications through the standardised OSA interface upon which service developers can rely when designing new services (or enhancements/variants of already existing ones).

The aim of OSA is to provide a standardised, extensible and scalable interface that allows for inclusion of new functionality in the network with a minimum impact on the applications using the OSA interface.

# 5 The role of OSA within the VHE framework for services

The goal of standardisation in 3GPP with respect to services is to provide a framework within which services can be created based on standardised service capability features (c.f. [1]). 3GPP services will generally not rely on the traditional detailed service engineering (evident for supplementary services in second-generation systems), but instead provides services using generic toolkits.

OSA is one of these toolkits, standardised within 3GPP, for the support of services within 3GPP system (see chapter 5.1).

Services can be implemented by applications using service capability features [1], which are accessible via the OSA interface towards these SCFs in the network.

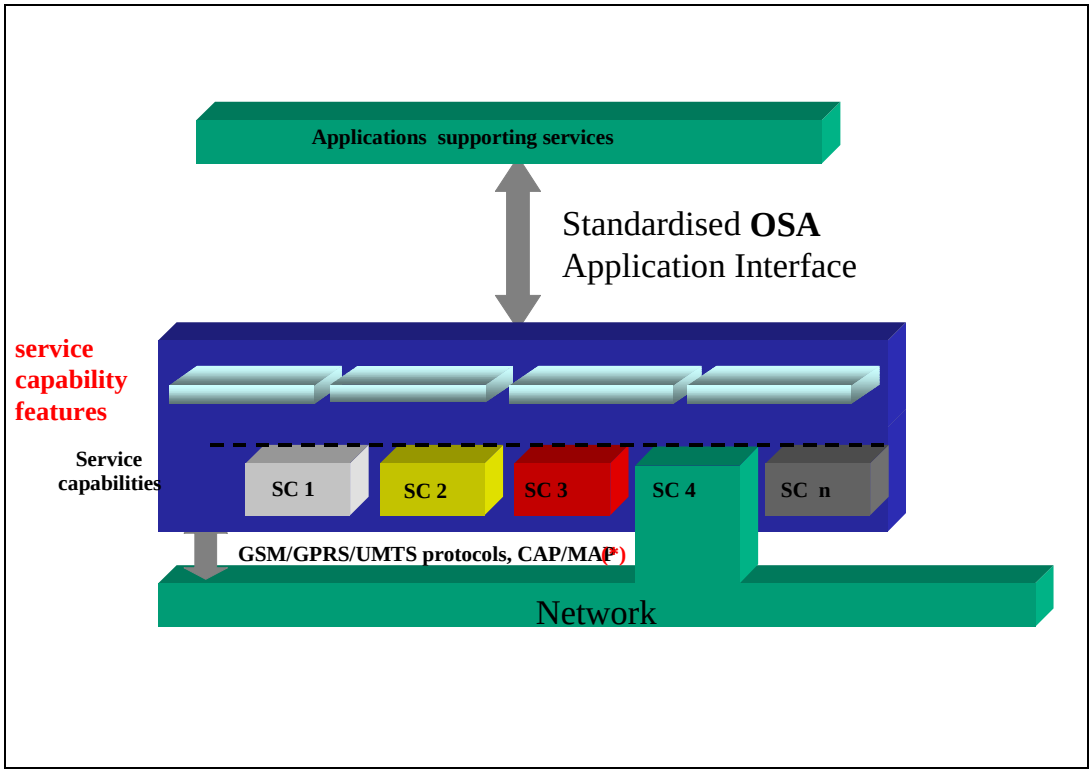

**Figure 3: Applications access Service Capability Features via the standardised OSA Application Interface**

## 5.1 Physical location of applications using the OSA interface

The physical location of applications accessing the OSA application programming interface is an implementation matter. This TS places no requirements on the physical location of the applications accessing the OSA application programming interface.

The only requirement on such applications accessing the OSA application programming interface is that they shall only do so via the framework for services [1].

The architectural support of the OSA application programming interface shall permit applications access to the OSA API independent of where the applications are physically executing.

# 6 High level requirements to OSA

The following high level requirements apply to the OSA application programming interface (API). The standardised API shall be:

- independent of vendor specific solutions;
- independent of programming languages, operating systems etc used in the service capabilities;
- secure, scalable and extensible;
- independent of the location where service capabilities are implemented;
- independent of supported server capabilities in the network;
- Access to Service Capability Features shall be realised using modern state of the art access technologies, e.g. distributed object oriented technique might be considered.;
- OSA shall be aligned as far as possible with equivalent work in other bodies, such as ETSI SPAN and Parlay;
- OSA shall allow applications access to home network service capability features. Access to Service capability features other than those provided by the home network is not required.

# 7 Requirements for user data management

No requirements for this release are identified

# 8 Charging and traceability requirements

## 8.1 Charging Requirements

The charging functionality of OSA allows an application to raise a charge against a subscriber's account for goods and services provided to her. It enables the invoicing, by the operator, of soft (e.g. download of software, music,...) and hard goods (e.g. CDs, books,...), which potentially are provided by third parties.

Additionally, the charging functionality of OSA shall provide for the maintenance of non-monetary subscriber accounts. An application may add or deduct non-monetary units to or from these accounts.

The responsibility for the subscriber accounts can be assigned to either the home network or elsewhere.:

- If the home network does not handle the accounts itself, charging requests are sent from the home network (and possible other applications) to a dedicated charging application, typically a charging centre. This case is out of scope of OSA.
- If the accounts are handled by the home network, the operator takes care of them.
  They may be used to charge for network resource usage (*call charging*, as it is done today) as well as any non-telecommunication related activity (any *E-commerce activity like service usage, online purchases*...)

OSA shall provide sufficient functions to support charging when the accounts are handled by the home network.

Two cases need to be considered in more detail:

> **Call and Event Charging**: OSA shall enable applications to control the charge of a call and / or an event that is under supervision of this application. OSA shall allow an application to provide additional charging information to the network;
>
> **Service Usage** (e.g. Online Purchases): On the other hand, OSA shall allow to employ the charging capabilities of the network to charge subscribers for any kind of service or even online purchases. Calculation of the charge may be based on monetary and/or non monetary grounds.

Beyond this, there are **general** charging **functions** on subscriber accounts (monetary and non-monetary) that shall be available via OSA:

- Query the current account balance and current reservations.
- Monitor account access (send notifications if charges or recharges are applied to a subscriber's account).
- Retrieve the history of the transactions

## 8.2 Traceability requirements

No requirements for this release are identified.

# 9 Security requirements

## 9.1 Security requirements on User Profile management

No requirements for this release are identified.

# 10 Requirements for Policy Management

No requirements for this release are identified.

# 11 Event Notification Function

The Event Notification Function shall allow an application to specify the initial point of contact which it is interested in. The Event Notification Function provides the necessary mechanisms which enables an application to request the notification of subscriber or network related event(s). An application may in addition request the cancellation of subscriber or network related event notification. For all subscriber related events the application shall always specify the subscriber for which the Event Notification Function is valid. Once an application has enabled the notification of event(s), the Event Notification Function shall report the event(s) until such time the application explicitly requests the termination of the event(s) notification.

When the event occurs, the application that requested the event is informed.. The notification of the event shall be accompanied by unambiguous information identifying the original request and event related data. For example, in case of an application is interested in "message" the notification to the application shall indicate whether it is incoming or outgoing, in case of chargeable events, the application shall receive details as used at the network to create a Call Detail Record. In this case, processing in the network is not suspended after notification of the event to the application.

The Event Notification Function includes the availability of offering additional criteria to be specified by the application. The set of criteria is individual and may vary for the event requested. The detailed set of criteria available for each of the events above are described in [6].

## 11.1 Subscriber Related events:

- A user becomes available.

  when a subscriber registers to a network and this event is armed by an application, that application shall be notified. Registration in this sense is further detailed in chapter 12.3.1. Attach and detach applies for CS and PS.

- An initial call processing event occurs.

  when a call to or from a given user is created and this event is armed by an application, that application shall be notified.

- A message is sent or received.

  when a message to or from a given user is sent or received and this event is armed by an application, that application shall be notified.

- A chargeable event happens.

  when a chargeable event occurs for a given user and this event is armed by an application, that application shall be notified.

- The user´s status is changed.

  when a given user changes her status (e.g. from idle to busy) and this event is armed by an application, that application shall be notified.

- The user´s location is changed.

  when a given user changes her location (e.g. leaving a certain area which is “identifiable” by the network) and this event is armed by an application, that application shall be notified.

## 11.2 Network Related Events:

- A network fault management condition is met.

  when a fault management condition occurs at the underlying network (e.g. congestion of network components) and this event is armed by an application, that application shall be notified.

# 12 Functions offered by OSA

Functions that are offered by OSA shall be applicable for a number of different business and applications domains (including besides the telecommunication network operators also service provider, third party service providers acting as HE-VASPs, etc.).

All of these businesses have different requirements, ranging from simple telephony and call routing, virtual private networks to fully interactive multimedia to using MS based applications.

**Service Capability Features:**

Application/Clients access OSA functions in terms of service capability features via the standardised application interface. This means that service capability features are accessible and visible to application/clients via the method/operation invocations in the interface.

Service capability features shall be defined as much as possible in a generic way to hide the network specific implementation. To achieve this, it is necessary to identify the functionalities that can be provided in different ways by the use of different service capabilities. For example, User Location can be produced in several underlying ways.Each of these functionalities can then be defined as a single generic function and the different underlying service capabilities are not visible to the application. It is important that the generic part becomes as large as possible to enable applications to use functions without the need for knowledge of the underlying network capabilities

When applications use the generic service capability features, these applications become independent of the network domain ie network agnostic. Applications shall however still be able to request service capability features specific to a service capability (e.g. Call Setup from CAMEL) or specific to a particular network domain. This will increase dependency of the application on the used service capability while providing improved optimisation.

Note: the grouping of OSA functions into Service Capability features is out of scope of this document.

Three different types of OSA functions can be distinguished:

- **Framework functions**: provide commonly used utilities, necessary for access control, security, resilience and management of OSA functions;

- **Network functions**: these shall enable the applications to make use of the functionality of the underlying network capabilities.

- **User Data** related functions: these enable applications to access data of a particular user. Such data are e.g. the status of the user, her location or data in the user's User Profile.

# 12.1 The Framework functions

The framework provides the essential capabilities that allow OSA applications to make use of the service capabilities in the network. There are three distinct features that comprise the framework: *Trust and Security Management, Service Registration and Discovery functions* and *Integrity Management*.

## 12.1.1 Trust and Security Mangement

The trust and security management feature provides the necessary mechanisms which define the security parameters in which client applications may access the network. This includes the availability of a framework initial access point through which all client applications are authenticated and authorised and the ability to allow the signing of on-line service level agreements between the client applications and the framework.

### 12.1.1.1 Authentication

Authentication is used to verify the identity of an entity (user, network, and application).

Three types of authentication are distinguished:

- **User-Network Authentication:**
  Before a user can access her subscribed applications, the user has to be authenticated by the network that provides access to the application. This allows the network to check to what applications the user has subscribed to. User-network authentication *is handled within the network and therefore outside the scope of the present document*.

- **Application-Network Authentication:**
  Before an application can use the capabilities from the network, a service agreement has to be established between the application and the network. Establishment of such a service agreement starts with the mutual authentication between application and network. If a service agreement already exists, modification might be needed or a new agreement might supersede the existing.

- **User-Application Authentication:**
  Before a user can use an application or perform other activities (e.g. modifying profile data) the application must authenticate the user. When the network already authenticates the user, authentication is not needed anymore. When the network is transparent and the user accesses an application directly, authentication is needed between user and application but this is outside the scope of the present document.

### 12.1.1.2 Authorisation

Authorisation is the activity of determining what an authenticated entity (user, network, and application) is allowed to do.

NOTE: Authentication must therefore precede authorisation.

Two types of authorisation are distinguished:

- **Application-Network Authorisation:**
  Verifies what non-framework functions the application is allowed to use. Once an application has been authorised to use one, more or all non-framework functions no further authorisation is required as long as the "allowed" non-framework functions are used.

- **User-Application Authorisation:**
  The application verifies what actions the user is allowed to perform (e.g. deactivation of functionality, modification of application data). This is transparent to the network and therefore outside the scope of the present document.

### 12.1.2 Service Registration feature

The Registration function enables the non-framework service capability features (i.e. service capability features that contain non-Framework functions) to register with the Framework. Registration must take place before authorised applications can find out from the Framework which non-framework service capability features are available. This means that the non-framework service capability features must be registered before they can be discovered and used by authorised applications. The service capability feature is finally registered if the registration process is successfully completed.

Note that only the non-framework service capability features have to be registered. The Framework service capability features (containing only Framework functions) are available by default since they provide basic mechanisms.

### 12.1.3 Service Discovery feature

The Discovery function enables the application to identify the total collection of service capability features that it can use. Upon request of the application, the Discovery function indicates the non-framework service capability features that are available for use by the application. The list of available service capability features is created through the Registration process described in subclause 12.1.2. This means that a service capability feature must be registered at the Framework before it can be discovered by the application.

### 12.1.4 Integrity Management function

Integrity management provides the means to allow the framework to query and report conditions that relate to the integrity of the framework, the network service capability features and the client applications. Furthermore an application may query conditions that relate to the integrity of the framework ad the network service capability features and report on it's own conditions. As part of the integrity management functions, the framework may provide:

- supervision of the status of client applications to ensure continued operation, a process known as heartbeating.
- fault management reporting and control. Specific examples include the ability for the framework to notify applications of internal fault conditions as well as faults in the network service capability features and the ability for applications to request specific test executions in the framework.
- operations and maintenance access, more specifically, the ability for the application to synchronise with the system date and time.

## 12.2 Network functions

The Network functions represent the total collection of network resources.
The following subclauses define generic network functions e.g. for Session Control and Message Transfer.

### 12.2.1 Call Control functions

This subclause details with Call Control functions. The purpose of this function is to allow applications to control and monitor calls, both circuit and packet switched.

The application may request the quality of service when first negotiated at the start of the call and may also request the network to notify the application of any changes in QoS (conversational, background, interactive and streaming class - see [4]) which take place during the call.

For QoS information, the Call Control Function allows applications to monitor the amount of used traffic channels and bandwidth (e.g. for HSCSD) and used timeslots (e.g. for GPRS).

#### 12.2.1.1 CS Call Control functions

This subclause details with circuit switched call control functions. The purpose of this function is to allow applications to control and monitor calls.

Applications should have the ability to :

- **Release Calls:**

  This provides the ability for the application to force the release of a call. The application may provide an indication of the reason for release of the call.

- **Control Calls:**

  This provides the ability for an application to modify the information pertaining to the call at the time of establishment of the call. The application may also allow the call to continue with or without the modified information pertaining to the call. The application shall have the ability to request call events of the call under control to be observed by the network and reported back to the application.

- **Request call information:**

  This provides the ability for an application to request information relating to the call of interest specified in advance. Requested information includes at least call duration, call end time.

- **Monitor calls:**

  This provides the ability for an application to monitor for call duration and tariff switching moments. An application may specify a threshold for the duration of a call or a part thereof. The application shall have the ability to grant new thresholds when the expiry of a previously set threshold has been reported to the application. When an event is subject to be monitored and the event is met, the application shall get informed accompanied with sufficient information.

- **Presentation of, or restriction of, information associated with a party involved in a call (e.g. calling line ID, calling name);**

- **Relinquish control over a call**

  This allows an application to relinquish control over a call but still allowing the established call to continue. Once the control of the call has been relinquished, the application may not be able to regain control over that call.

- **Interact with a user**

  This provides the ability for an application to interact with a user. An application may be able to send specific information to the user and may request the collection of data from the user. Sending information to the user or collecting information from the user shall be supported when the user is engaged in a call (e.g. USSD, DTMF) or call-unrelated (e.g. USSD, SMS). The information sent to the user may include an indication of an announcement, text or user specific data.

  Note: Call related user interaction may e.g. be used to play/record/customise user specific announcements while through call-unrelated user interaction e.g. service preferences may be managed.

For each call it shall be possible to specify:

- the events on which monitoring is required ([10]).

NOTE: The mapping to service capabilities is for further study (it shall be investigated to which extend the requirements above fit to CAMEL, MEXE and other service capabilities).

#### 12.2.1.2 PS Call Control functions

This subclause details with packet switched call control functions. The purpose of this function is to allow applications to control and monitor GPRS sessions. A GPRS Session may consists of one or more GPRS PDP context.

Applications should have the ability to :

- **Release a PDP context:**

This provides the ability for the application to force a PDP context to be released. The application may provide an indication of the reason for release of the PDP context.

- **Control a PDP context:**

  This provides the ability for an application to modify the information pertaining to the PDP context at the time of establishment. The application may also allow the PDP context to continue with or without the modified information pertaining to the PDP context. The application shall have the ability to request events to be observed by the network and reported back to the application.

- **Monitor a PDP context:**

  This provides the ability for an application to monitor for PDP context duration and tariff switching moments.. An application may specify a threshold for the duration of a PDP context or a part thereof. The application shall have the ability to grant new thresholds when the expiry of a previously set threshold has been reported to the application.

- **Monitor a GPRS session:**

  This provides the ability for an application to monitor for GPRS session data volume. An application may specify a threshold for the amount of data allowed to be transferred within a GPRS session. The application shall have the ability to grant new thresholds when the expiry of a previously set threshold has been reported to the application.

#### 12.2.1.3 IM Call Control functions

No requirements for this release are identified

### 12.2.2 Multi-Media Channel Control:

No requirements for this release are identified.

### 12.2.3 Information Transfer function

The Information Transfer function shall enable an application to indicate to a user respectively an application in the UE or USIM about the presence of existing information for her. Physically, this indication may be sent by the underlying network e.g. as a SMS or USSD message to the terminal. The Information Transfer function provides the means to inform the underlying network that an indication shall be sent to the user.

NOTE: For 3GPP mechanisms like USSD or SMS may be employed to transfer the indication to the users terminal.

The following functions shall be supported:

- **send information notification:**

  - the Send information notification function provides the means to inform the underlying network that an indication shall be sent to a user respectively an application in the UE or USIM about the presence of existing information for her;

- **request message receipt notification:**

  - the application can request to receive a notification every time a message is received in the mailbox for the user. This allows the application to take the appropriate action, e.g. informing the user.

### 12.2.4 Charging functions

**Call and Event Charging**

Call and Event Charging functions enable the application to instruct the network and inform the user with charging information and to add some additional charging information to the network generated Call Detail Records. Some of the following charging facilities are available only if the network either controls the account or has access to it.

The OSA Call and Event Charging function shall enable an application to:

- define and manage thresholds (e.g. session duration, data volume) for a call;
- provide additional charging information to be included in the Call Detail Record. This may contain information transparent to the network;
- transfer Advice of Charge data (as defined in [5]) to the terminal.

**Service Usage**

These charging functions shall enable applications to augment subscriber accounts maintained by the network and to charge subscribers for using services. These applications are not necessarily telecommunication related. In addition to charging subscribers for service usage, these functions could also be used for payments in an online purchase scenario.

Provided, that these functions are supported by the underlying network an application shall be able to:

- Check, if – for the service to be provided by the application – the charge is covered by the subscribers account or credit limit
- Reserve – for the service to be provided by the application – a charge in the subscribers account, that can be deduced from the account after service delivery.
- Deduct an amount from the subscriber's account. If a reservation has been made earlier, this amount should be taken from the reserved amount.
- Release a reservation acquired earlier. If part of a reservation has been deducted already, just release the remaining reservation.
- Add non-monetary units to a subscriber's account.
- Deduct non-monetary units from a subscriber's account.
- Reverse a completed charge transaction, e.g. after repudiation.

The functions for charging application usage shall meet the following general requirements:

- Hide payment policy (e.g. prepaid/postpaid) from applications
- Hide payment type (credit card, cash, bank withdrawal) from applications
- Hide subscriber's identity towards the application. This would provide anonymity (like for prepaid customers).
- Support prepaid subscribers. This requires that the application immediately gets informed if the subscriber's account covers the service usage costs. If not, the application may reject serving the subscriber.
- Allow for Multi-currency support. This shall allow service providers to request charging in their preferred currency

**General Account functions**

These functions provide access to sensitive data. They shall be restricted to client applications that had been granted additional privileges via suitable means, i.e. as authorised by the framework function.

The OSA general Account function shall enable an application to:

- retrieve a transaction history of a subscriber's account, this may include
  - the retrieval of a list of monetary or non-monetary amounts that have been debited from or credited to a subscribers online account,
  - the request of additional information on the specific transaction (e.g. the application or service description provided with the actual transaction).
- check a subscriber's current account balance.
- monitor the subscribers account and may request to get informed of any change.

In case an application retrieves a list for a subscribers' transaction history, it shall specify the time interval for which the transaction history shall be retrieved.

## 12.3 User data related functions

### 12.3.1 User Status functions

The User Status functions enable an application to retrieve the user's status, i.e. to find out on which terminals the user is available.

The following functions shall be provided:

- **retrieval of User Status:**
  - the application shall be able to retrieve the status of the user.
- **notification of User Status Change:**
  - the application shall receive notifications when the user's terminal attaches or detaches:
    - detach: the user's terminal is switched off or the network initiates detach upon location update failure;
    - attach: the user's terminal is switched on or there has been a successful location update after network initiated detach.

The application shall be able for each terminal to start/stop receipt of notifications.

### 12.3.2 User Location functions

The User Location functions provide an application with information concerning the user's location.

The user location information contains the following attributes:

- **location** (e.g. in terms of universal latitude and longitude co-ordinates);
- **accuracy** (value depending on local regulatory requirements and level of support in serving/home networks; note that the accuracy of the serving network might differ from that in the home environment);
- **age** of location information (last known date/time made available in GMT).

The following functions shall be provided:

- **report of location information:**
  - the application shall be able to request user location information;
  - by default the location information is provided once; the application may also request periodic location reporting (i.e. multiple reports spread over a period of time).
- **notification of location update:**
  - the application shall be able to request to be notified when the user's location changes, i.e. when:
    - the user enters or leaves a specified geographic area;
    - the user's location changes more than a specified lower boundary. The lower boundary can be selected from the options provided by the network.

The application shall be able for each user to start/stop receipt of notifications and to modify the required accuracy by selecting another option from the network provided options.

- **Access control to location information:**

- the user shall be able to restrict/allow access to the location information. The restriction can be overridden by the network operator when appropriate (e.g. emergency calls).

### 12.3.3 User Profile Management functions

No requirements for this release are identified.

### 12.3.4 User Profile access Authentication/Authorisation functions

No requirements for this release are identified.

### 12.3.5 Terminal Capabilities functions

The Terminal Capabilities functions enable the application to determine the capabilities of the user's terminal .

Note 1: The ability to support this function is dependent on the ability of a terminal (through e.g. MExE or WAP) to notify its terminal capabilities. Therefore this function will *not* be able to supply terminal capabilities for terminals not supporting notification of their terminal capabilities.

Note 2: "Terminal" covers both (mobile) equipment and USIM.

The following functions shall be provided:

- **retrieval of Terminal Capabilities:**
  - the application shall be able to retrieve the capabilities of the terminal. This includes:
    - the media that the terminal is capable to deal with (e.g. audio, video, ; this information is needed by the application e.g. when the user wants to download messages from the mailbox);
    - the number of calls/sessions that the terminal can deal with simultaneously.

### 12.3.6 Functions for retrieval of Network Capabilities

No requirements for this release are identified
