DECTTM, **PLUGTESTSTM**, **UMTSTM**, **TIPHON**TM, the TIPHON logo and the ETSI logo are Trade Marks of ETSI registered for the benefit of its Members.

3GPP[™] is a Trade Mark of ETSI registered for the benefit of its Members and of the 3GPP Organizational Partners.

LTE[™] is a Trade Mark of ETSI currently being registered

for the benefit of its Members and of the 3GPP Organizational Partners.

GSM® and the GSM logo are Trade Marks registered and owned by the GSM Association.

Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://webapp.etsi.org/IPR/home.asp).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under <u>http://webapp.etsi.org/key/queryform.asp</u>.

8.3.1	Single Link Performance	
8.3.1.1	Minimum requirement	
8.4	Demodulation of DCH in moving propagation conditions	
8.4.1	Single link performance	
8.4.1.1	Minimum requirement	
8.5	Demodulation of DCH in birth-death propagation conditions	
8.5.1	Single link performance	
8.5.1.1	Minimum requirement	
8.5A	Demodulation of DCH in high speed train condition	
8.5A.1	General	
8.5A.2	Minimum requirement	
8.6	Demodulation of DCH in downlink Transmit diversity modes	
8.6.1	Demodulation of DCH in open-loop transmit diversity mode	
8.6.1.1	Minimum requirement	
8.6.2	Demodulation of DCH in closed loop transmit diversity mode	
8.6.2.1	Minimum requirement	
8.6.3	(void)	
8.7	Demodulation in Handover conditions	
8.7.1	Demodulation of DCH in Inter-Cell Soft Handover	
8.7.1.1	Minimum requirement	
8.7.2	Combining of TPC commands from radio links of different radio link sets	
8.7.2.1	Minimum requirement	
8.7.3	Combining of reliable TPC commands from radio links of different radio link sets	
8.7.3.1	Minimum requirement	
8.8	Power control in downlink	
8.8.1	Power control in the downlink, constant BLER target	
8.8.1.1	Minimum requirements	
8.8.2	Power control in the downlink, initial convergence	
8.8.2.1	Minimum requirements	
8.8.3	Power control in downlink, wind up effects	
8.8.3.1	Minimum requirements	
8.8.4	Power control in the downlink, different transport formats	
8.8.4.1	Minimum requirements	
8.8.5	Power control in the downlink for F-DPCH	
8.8.5.1	Minimum requirements	
8.9	Downlink compressed mode	
8.9.1	Single link performance	
8.9.1.1	Minimum requirements	
8.10	Blind transport format detection.	
8.10.1	Minimum requirement	
8.11	Detection of Broadcast channel (BCH)	
8.11.1	Minimum requirement without transmit diversity	
8.11.2	Minimum requirement with open loop transmit diversity	
8.12	Demodulation of Paging Channel (PCH)	
8.12.1	Minimum requirement	
8.13	Detection of Acquisition Indicator (AI)	
8.13.1	Minimum requirement	
8.13A	Detection of E-DCH Acquisition Indicator (E-AI)	
8.13A.1	Minimum requirement	
8.14	UE UL power control operation with discontinuous UL DPCCH transmission operation	
8.14.1	Minimum requirement	
8.15	(void)	
8.15	(void)	
9 P	erformance requirement (HSDPA)	
9.1	(void)	
9.2	Demodulation of HS-DSCH (Fixed Reference Channel)	
9.2.1	Single Link performance	
9.2.1.1	Requirement QPSK, Fixed Reference Channel (FRC) H-Set 1/2/3/3A	
9.2.1.2	Requirement 16QAM, Fixed Reference Channel (FRC) H-Set 1/2/3	
9.2.1.3	Minimum requirement QPSK, Fixed Reference Channel (FRC) H-Set 4/5

Foreword

This Technical Specification (TS) has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
 - 1 presented to TSG for information;
 - 2 presented to TSG for approval;
 - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

1 Scope

The present document establishes the minimum RF characteristics of the FDD mode of UTRA for the User Equipment (UE).

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

3 Definitions, symbols and abbreviations

3.1 Definitions

For the purposes of the present document, the following definitions apply:

Enhanced performance requirements type 1: This defines performance requirements which are optional for the UE. The requirements are based on UEs which utilise receiver diversity.

Enhanced performance requirements type 2: This defines performance requirements which are optional for the UE, The requirements are based on UEs which utilise a chip equaliser receiver structure.

Enhanced performance requirements type 3: This defines performance requirements which are optional for the UE, The requirements are based on UEs which utilise a chip equaliser receiver structure with receiver diversity.

Enhanced performance requirements type 3i: This defines performance requirements which are optional for the UE, The requirements are based on UEs which utilise an interference-aware chip equaliser receiver structure with receiver diversity.

Power Spectral Density: The units of Power Spectral Density (PSD) are extensively used in this document. PSD is a function of power versus frequency and when integrated across a given bandwidth, the function represents the mean power in such a bandwidth. When the mean power is normalised to (divided by) the chip-rate it represents the mean energy per chip. Some signals are directly defined in terms of energy per chip, (DPCH_E_c, E_c, OCNS_E_c and S-CCPCH_E_c) and others defined in terms of PSD (I_o, I_{oc}, I_{or} and \hat{I}_{or}). There also exist quantities that are a ratio of energy per chip to PSD (DPCH_E_c/I_{or}, E_c/I_{or} etc.). This is the common practice of relating energy magnitudes in communication systems.

It can be seen that if both energy magnitudes in the ratio are divided by time, the ratio is converted from an energy ratio to a power ratio, which is more useful from a measurement point of view. It follows that an energy per chip of X dBm/3.84 MHz can be expressed as a mean power per chip of X dBm. Similarly, a signal PSD of Y dBm/3.84 MHz can be expressed as a signal power of Y dBm.

Maximum Output Power: This s a measure of the maximum power the UE can transmit (i.e. the actual power as would be measured assuming no measurement error) in a bandwidth of at least $(1 + \alpha)$ times the chip rate of the radio access mode. The period of measurement shall be at least one timeslot.

Mean power: When applied to a W-CDMA modulated signal this is the power (transmitted or received) in a bandwidth of at least $(1 + \alpha)$ times the chip rate of the radio access mode. The period of measurement shall be at least one timeslot unless otherwise stated.

Nominal Maximum Output Power: This is the nominal power defined by the UE power class.

Primary uplink frequency: If a single uplink frequency is configured for the UE, then it is the primary uplink frequency. In case more than one uplink frequency is configured for the UE, then the primary uplink frequency is the frequency on which the E-DCH corresponding to the serving E-DCH cell associated with the serving HS-DSCH cell is transmitted. The association between a pair of uplink and downlink frequencies is indicated by higher layers.

RRC filtered mean power: The mean power as measured through a root raised cosine filter with roll-off factor α and a bandwidth equal to the chip rate of the radio access mode.

- NOTE 1: The RRC filtered mean power of a perfectly modulated W-CDMA signal is 0.246 dB lower than the mean power of the same signal.
- NOTE 2: The roll-off factor α is defined in section 6.8.1.

Secondary serving HS-DSCH cell(s): In addition to the serving HS-DSCH cell, the set of cells where the UE is configured to simultaneously monitor an HS-SCCH set and receive the HS-DSCH if it is scheduled in that cell. There can be up to 3 secondary serving HS-DSCH cells.

Secondary uplink frequency: A secondary uplink frequency is a frequency on which an E-DCH corresponding to a serving E-DCH cell associated with a secondary serving HS-DSCH cell is transmitted. The association between a pair of uplink and downlink frequencies is indicated by higher layers.

Throughput: Number of information bits per second excluding CRC bits successfully received on HS-DSCH by a HSDPA capable UE.

1st secondary serving HS-DSCH cell: If the UE is configured with two uplink frequencies, the 1st secondary serving HS-DSCH cell is the secondary serving HS-DSCH cell that is associated with the secondary uplink frequency. If the UE is configured with a single uplink frequency, the 1st secondary serving HS-DSCH cell is a secondary serving HS-DSCH cell whose index is indicated by higher layers.

3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply:

4C-HSDPA	Four-Carrier HSDPA. HSDPA operation configured on 3 or 4 DL carriers.
ACLR	Adjacent Channel Leakage power Ratio
ACS	Adjacent Channel Selectivity
AICH	Acquisition Indication Channel

BER BLER CQI CW DB-DC-HSDPA DC-HSDPA DC-HSUPA DCH DIP DL DTX DPCCH DPCH DPCH_E _c	Bit Error Ratio Block Error Ratio Channel Quality Indicator Continuous Wave (un-modulated signal) Dual Band Dual Cell HSDPA Dual Cell HSDPA Dual Cell HSUPA Dedicated Channel, which is mapped into Dedicated Physical Channel. Dominant Interferer Proportion ratio Down Link (forward link) Discontinuous Transmission Dedicated Physical Control Channel Dedicated Physical Control Channel Dedicated Physical Channel Average energy per PN chip for DPCH.
$\frac{\text{DPCH}_{E_{c}}}{I_{\text{or}}}$	The ratio of the transmit energy per PN chip of the DPCH to the total transmit power spectral
I_{or}	density at the Node B antenna connector.
DPDCH	Dedicated Physical Data Channel
E-DCH	Enhanced Dedicated Channel
E-AGCH	E-DCH Absolute Grant Channel
E-HICH E-RGCH	E-DCH HARQ ACK Indicator Channel E-DCH Relative Grant Channel
EIRP	Effective Isotropic Radiated Power
E _c	Average energy per PN chip.
$\frac{E_c}{I_{or}}$	The ratio of the average transmit energy per PN chip for different fields or physical channels to the
1 _{or}	
FACH	total transmit power spectral density. Forward Access Channel
FDD	Frequency Division Duplex
FDR	False transmit format Detection Ratio. A false Transport Format detection occurs when the
	receiver detects a different TF to that which was transmitted, and the decoded transport block(s)
_	for this incorrect TF passes the CRC check(s).
F_{uw}	Frequency of unwanted signal. This is specified in bracket in terms of an absolute frequency(s) or
	a frequency offset from the assigned channel frequency. For DC-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency used and positive offset refers to
	the assigned channel frequency of the highest carrier frequency used and positive onset feters to the assigned channel frequency of the highest carrier frequency used. For DB-DC-HSDPA, offset
	refers to the assigned channel frequencies of the individual cells.
HARQ	Hybrid Automatic Repeat Request
HSDPA	High Speed Downlink Packet Access
HSUPA HS-DSCH	High Speed Uplink Packet Access High Speed Downlink Shared Channel
HS-PDSCH	High Speed Physical Downlink Shared Channel
HS-SCCH	High Speed Shared Control Channel
Information Dat	
	Rate of the user information, which must be transmitted over the Air Interface. For example,
т	output rate of the voice codec.
I _o	The total received power spectral density, including signal and interference, as measured at the UE
т	antenna connector.
I_{oc}	The power spectral density (integrated in a noise bandwidth equal to the chip rate and normalized
	to the chip rate) of a band limited white noise source (simulating interference from cells, which are not defined in a test procedure) as measured at the UE antenna connector. For DC-HSDPA and
	DB-DC-HSDPA, I_{oc} is defined for each of the cells individually and is assumed to be equal for
	both cells unless explicitly stated per cell.
I _{oc} "	The received power spectral density (integrated in a noise bandwidth equal to the chip rate and normalized to the chip rate) of the summation of the received power spectral densities of the two strongest interfering cells plus I_{oc} as measured at the UE antenna connector. The respective power spectral density of each interfering cell relative to I_{oc} " is defined by its associated DIP value.
	spectru density of each interfering confictative to 1_{0C} is defined by its associated D11 value.

I _{otx}	The power spectral density (integrated in a noise bandwidth equal to the chip rate and normalized
• otx	to the chip rate) of a band limited white noise source (simulating Node B transmitter impairments)
	as measured at the Node B transmit antenna connector(s). For DC-HSDPA and DB-DC-HSDPA,
	I_{otx} is defined for each of the cells individually and is assumed to be equal for both cells unless
	explicitly stated per cell.
I _{or}	The total transmit power spectral density (integrated in a bandwidth of $(1+\alpha)$ times the chip rate
	and normalized to the chip rate) of the downlink signal at the Node B antenna connector. For DC-
	HSDPA and DB-DC-HSDPA, I_{or} is defined for each of the cells individually and is assumed to be
	equal for both cells unless explicitly stated per cell.
$\mathbf{\hat{I}}_{\mathrm{or}}$	The received power spectral density (integrated in a bandwidth of $(1+\alpha)$ times the chip rate and
or	normalized to the chip rate) of the downlink signal as measured at the UE antenna connector. For
	DC-HSDPA and DB-DC-HSDPA, $\hat{\mathbf{I}}_{or}$ is defined for each of the cells individually and is assumed
MBSFN	to be equal for both cells unless explicitly stated per cell. MBMS over a Single Frequency Network
MER	Message Error Ratio
MIMO	Multiple Input Multiple Output
Node B	A logical node responsible for radio transmission / reception in one or more cells to/from the User
OCNS	Equipment. Terminates the lub interface towards the RNC Orthogonal Channel Noise Simulator, a mechanism used to simulate the users or control signals on
OCINS	the other orthogonal channels of a downlink link.
OCNS_E _c	Average energy per PN chip for the OCNS.
\underline{OCNS}_{E_c}	The ratio of the average transmit energy per PN chip for the OCNS to the total transmit power
I or	
D CODOU	spectral density.
P-CCPCH PCH	Primary Common Control Physical Channel Paging Channel
	The ratio of the received P-CCPCH energy per chip to the total received power spectral density at
$P - CCPCH \frac{E_c}{I_o}$	The fails of the received r-CCr Cri energy per chip to the total received power spectral density at
P. 669-644 P	the UE antenna connector.
$\frac{P - CCPCH _ E_c}{I_{or}}$	The ratio of the average transmit energy per PN chip for the P-CCPCH to the total transmit power
D CDICU	spectral density.
P-CPICH PICH	Primary Common Pilot Channel Paging Indicator Channel
PPM	Parts Per Million
R	Number of information bits per second excluding CRC bits successfully received on HS-DSCH by
	a HSDPA capable UE.
<refsens></refsens>	Reference sensitivity
$<$ REF $\hat{I}_{or} >$	Reference \hat{I}_{or}
RACH	Random Access Channel
SCH S – CCPCH	Synchronization Channel consisting of Primary and Secondary synchronization channels Secondary Common Control Physical Channel.
$S - CCPCH _ E_c$	Average energy per PN chip for S-CCPCH.
SG	Serving Grant
SIR	Signal to Interference ratio
SML	Soft Metric Location (Soft channel bit)
STTD	Space Time Transmit Diversity
TDD TFC	Time Division Duplexing Transport Format Combination
TFCI	Transport Format Combination Indicator
TPC	Transmit Power Control
TSTD	Time Switched Transmit Diversity
UE UL	User Equipment Up Link (reverse link)
UTRA	UMTS Terrestrial Radio Access
01101	

4 General

4.1 Relationship between Minimum Requirements and Test Requirements

The Minimum Requirements given in this specification make no allowance for measurement uncertainty. The test specification 34.121 Annex F defines Test Tolerances. These Test Tolerances are individually calculated for each test. The Test Tolerances are used to relax the Minimum Requirements in this specification to create Test Requirements.

16

The measurement results returned by the test system are compared - without any modification - against the Test Requirements as defined by the shared risk principle.

The Shared Risk principle is defined in ETR 273 Part 1 sub-part 2 section 6.5.

4.2 Power Classes

For UE power classes 1 and 2, a number of RF parameter are not specified. It is intended that these are part of a later release.

4.3 Control and monitoring functions

This requirement verifies that the control and monitoring functions of the UE prevent it from transmitting if no acceptable cell can be found by the UE.

4.3.1 Minimum requirement

The power of the UE, as measured with a thermal detector, shall not exceed -30dBm if no acceptable cell can be found by the UE.

4.4 RF requirements in later releases

The standardisation of new frequency bands may be independent of a release. However, in order to implement a UE that conforms to a particular release but supports a band of operation that is specified in a later release, it is necessary to specify some extra requirements. TS 25.307 [9] specifies requirements on UEs supporting a frequency band that is independent of release.

NOTE: For terminals conforming to the 3GPP release of the present document, some RF requirements in later releases may be mandatory independent of whether the UE supports the bands specified in later releases or not. The set of requirements from later releases that is also mandatory for UEs conforming to the 3GPP release of the present document is determined by regional regulation.

5 Frequency bands and channel arrangement

5.1 General

The information presented in this subclause is based on a chip rate of 3.84 Mcps.

NOTE: Other chip rates may be considered in future releases.

5.2 Frequency bands

a) UTRA/FDD is designed to operate in the following paired bands:

Operating	UL Frequencies	DL frequencies
Band	UE transmit, Node B receive	UE receive, Node B transmit
I	1920 - 1980 MHz	2110 -2170 MHz
	1850 -1910 MHz	1930 -1990 MHz
III	1710-1785 MHz	1805-1880 MHz
IV	1710-1755 MHz	2110-2155 MHz
V	824 - 849 MHz	869-894 MHz
VI	830-840 MHz	875-885 MHz
VII	2500-2570 MHz	2620-2690 MHz
VIII	880 - 915 MHz	925 - 960 MHz
IX	1749.9-1784.9 MHz	1844.9-1879.9 MHz
Х	1710-1770 MHz	2110-2170 MHz
XI	1427.9 - 1447.9 MHz	1475.9 - 1495.9 MHz
XII	699 – 716 MHz	729 – 746 MHz
XIII	777 - 787 MHz	746 - 756 MHz
XIV	788 – 798 MHz	758 – 768 MHz
XV	Reserved	Reserved
XVI	Reserved	Reserved
XVII	Reserved	Reserved
XVIII	Reserved	Reserved
XIX	830 – 845MHz	875 – 890 MHz
XX	832 – 862 MHz	791 – 821 MHz
XXI	1447.9 – 1462.9 MHz	1495.9 – 1510.9 MHz

Table 5.0: UTRA FDD frequency bands

b) Deployment in other frequency bands is not precluded

c) DB-DC-HSDPA is designed to operate in the following configurations:

DB-DC-HSDPA	UL Band	DL	DL
Configuration		Band A	Band B
1	I or VIII	I	VIII
2	II or IV	II	IV
3	l or V	I	V
4	I or XI	I	XI
5	ll or V	II	V

d) Single band 4C-HSDPA is designed to operate in the following configurations:

Table 5.0aB Single band 4C-HSDPA configurations							
Single band 4C-HSDPA		Operating	Number of DL carriers				
Configuration		Band					
	I-3	I	3				
NOTE:	Single band 4C-HSDPA configuration is numbered as (X-M) where X denotes the operating band and M denotes the number of DL carriers.						

- e) Dual band 4C-HSDPA is designed to operate in the following configurations:

Table of a band for hept Ar bonnightations							
Dual band 4C-HSDPA Configuration	UL Band	DL Band A	Number of DL carriers in Band A	DL Band B	Number of DL carriers in Band B		
•		Dana	in Dana / t		in Dana D		
I-2-VIII-1	l or VIII		2	VIII	1		
I-3-VIII-1	I or VIII	I	3	VIII	1		
II-1-IV-2	II or IV	II	1	IV	2		
II-2-IV-1	II or IV	II	2	IV	1		
II-2-IV-2	II or IV		2	IV	2		
I-1-V-2	l or V	I	1	V	2		
I-2-V-1	l or V		2	V	1		
I-2-V-2	I or V	I	2	V	2		
NOTE: Dual band 4C-HSDPA configuration is numbered as (X-M-Y-N) where X denotes the DL Band A, M							
denotes the number DL carriers in the DL Band A, Y denotes the DL Band B, and N denotes the number							
of DL carriers i	n the DL Bar	nd B					

Table 5.0aC Dual band 4C-HSDPA configurations

5.3 TX-RX frequency separation

a) UTRA/FDD is designed to operate with the following TX-RX frequency separation

Operating Band	TX-RX frequency separation
I	190 MHz
II	80 MHz.
	95 MHz.
IV	400 MHz
V	45 MHz
VI	45 MHz
VII	120 MHz
VIII	45 MHz
IX	95 MHz
Х	400 MHz
XI	48 MHz
XII	30 MHz
XIII	31 MHz
XIV	30 MHz
XIX	45 MHz
XX	41 MHz
XXI	48 MHz

Table 5.0A: TX-RX frequency separation

- b) UTRA/FDD can support both fixed and variable transmit to receive frequency separation.
- c) The use of other transmit to receive frequency separations in existing or other frequency bands shall not be precluded.
- d) When configured to operate on dual cells in the DL with a single UL frequency, the TX-RX frequency separation in Table 5.0A shall be applied for the serving HS-DSCH cell. For bands XII, XIII and XIV, the TX-RX frequency separation in Table 5.0A shall be the minimum spacing between the UL and either of the DL carriers.
- e) When configured to operate on dual cells in both the DL and UL, the TX-RX frequency separation in Table 5.0A shall be applied to the primary UL frequency and DL frequency of the serving HS-DSCH cell, and to the secondary UL frequency and the frequency of the secondary serving HS-DSCH cell respectively.
- f) When configured to operate on single/dual band 4C-HSDPA with a single UL frequency, the TX-RX frequency separation in Table 5.0A shall be applied for the DL frequency of the serving HS-DSCH cell. When configured to operate on single/dual band 4C-HSDPA with dual UL frequencies, the TX-RX frequency separation in Table 5.0A shall be applied to the primary UL frequency and DL frequency of the serving HS-DSCH cell, and to the secondary UL frequency and the frequency of the 1st secondary serving HS-DSCH cell respectively.
- g) For bands XII, XIII and XIV, all the requirements in TS 25.101 are applicable only for a single uplink carrier frequency, however dual cell uplink operation may be considered in future releases.

5.4 Channel arrangement

5.4.1 Channel spacing

The nominal channel spacing is 5 MHz, but this can be adjusted to optimise performance in a particular deployment scenario. In DC-HSDPA and DB-DC-HSDPA mode, the UE receives two cells simultaneously. In context of DC-HSDPA and DB-DC-HSDPA, a cell is characterized by a combination of scrambling code and a carrier frequency, see [21.905].

5.4.2 Channel raster

The channel raster is 200 kHz, for all bands which means that the centre frequency must be an integer multiple of 200 kHz. In addition a number of additional centre frequencies are specified according to table 5.1A, which means that the centre frequencies for these channels are shifted 100 kHz relative to the general raster.

5.4.3 Channel number

The carrier frequency is designated by the UTRA Absolute Radio Frequency Channel Number (UARFCN). For each operating Band, the UARFCN values are defined as follows:

Uplink:	$N_U = 5 * (F_{UL} - F_{UL_Offset}),$	for the carrier frequency range $F_{UL_low} \le F_{UL} \le F_{UL_high}$

 $Downlink: \qquad N_D = 5 * (F_{DL} - F_{DL_Offset}), \quad \text{for the carrier frequency range } F_{DL_low} \leq F_{DL_bigh}$

For each operating Band, F_{UL_Offset} , F_{UL_low} , F_{UL_high} , F_{DL_Offset} , F_{DL_low} and F_{DL_high} are defined in Table 5.1 for the general UARFCN. For the additional UARFCN, F_{UL_Offset} , F_{DL_Offset} , and the specific F_{UL} and F_{DL} are defined in Table 5.1A.

	UI	PLINK (UL)		DOWNLINK (DL)				
	UE transr	UE transmit, Node B receive			UE receive, Node B transmit			
Band	UARFCN	Carrier freq	uency (F∪∟)	UARFCN	Carrier frequency (F _{DL})			
	formula offset	range	[MHz]	formula offset	range	[MHz]		
	F _{UL_Offset} [MHz]	$F_{UL_{low}}$	F_{UL_high}	F _{DL_Offset} [MHz]	$F_{DL_{low}}$	F_{DL_high}

Table 5.2: UTRA	Absolute Radio	Frequency	Channel	Number
-----------------	----------------	-----------	---------	--------

NOTE: If the UE is on a network with Mobile Country Code set to Japan then it may assume that any DL UARFCN sent by the network from the overlapping region of Band V and Band VI is from Band VI. If the UE is on a network with a Mobile Country Code other than Japan then it may assume that any DL UARFCN sent by the network from the overlapping region of Band V and Band VI is from Band V.

6 Transmitter characteristics

6.1 General

Unless otherwise stated, the transmitter characteristics are specified at the antenna connector of the UE. For UE with integral antenna only, a reference antenna with a gain of 0 dBi is assumed. Transmitter characteristics for UE(s) with multiple antennas/antenna connectors are FFS.

The UE antenna performance has a significant impact on system performance, and minimum requirements on the antenna efficiency are therefore intended to be included in future versions of the present document. It is recognised that different requirements and test methods are likely to be required for the different types of UE.

UEs supporting DC-HSUPA shall support both minimum requirements, as well as additional requirements for DC-HSUPA.

For the additional requirements for DC-HSUPA, all the parameters in clause 6 are defined using the UL E-DCH reference measurement channel, specified in subclause A.2.6. For the additional requirements for DC-HSUPA, the spacing of the carrier frequencies of the two cells shall be 5 MHz.

6.2 Transmit power

6.2.1 UE maximum output power

The following Power Classes define the nominal maximum output power. The nominal power defined is the broadband transmit power of the UE, i.e. the power in a bandwidth of at least $(1+\alpha)$ times the chip rate of the radio access mode. The period of measurement shall be at least one timeslot. For DC-HSUPA, the nominal transmit power is defined by the sum of the broadband transmit power of each carrier in the UE.

Operating	Power	Class 1	Power	Class 2	Power	Class 3	Power C	Power Class 3bis		Class 4
Band	Power	Tol	Power	Tol	Power	Tol	Power	Tol	Power	Tol
	(dBm)	(dB)	(dBm)	(dB)	(dBm)	(dB)	(dBm)	(dB)	(dBm)	(dB)
Band I	+33	+1/-3	+27	+1/-3	+24	+1/-3	23	+2/-2	+21	+2/-2
Band II	-	-	-	-	+24	+1/-3	23	+2/-2	+21	+2/-2
Band III	-	-	-	-	+24	+1/-3	23	+2/-2	+21	+2/-2
Band IV	-	-	-	-	+24	+1/-3	23	+2/-2	+21	+2/-2
Band V	-	-	-	-	+24	+1/-3	23	+2/-2	+21	+2/-2
Band VI	-	-	-	-	+24	+1/-3	23	+2/-2	+21	+2/-2
Band VII	-	-	-	-	+24	+1/-3	23	+2/-2	+21	+2/-2
Band VIII	-	-	-	-	+24	+1/-3	23	+2/-2	+21	+2/-2
Band IX	-	-	-	-	+24	+1/-3	23	+2/-2	+21	+2/-2
Band X	-	-	-	-	+24	+1/-3	23	+2/-2	+21	+2/-2
Band XI	-	-	-	-	+24	+1/-3	23	+2/-2	+21	+2/-2
Band XII	-	-	-	-	+24	+1/-3	23	+2/-2	+21	+2/-2
Band XIII	-	-	-	-	+24	+1/-3	23	+2/-2	+21	+2/-2
Band IV	-	-	-	-	+24	+1/-3	23	+2/-2	+21	+2/-2
Band XIX					+24	+1/-3	23	+2/-2	+21	+2/-2
Band XX					+24	+1/-3	23	+2/-2	+21	+2/-2
Band XXI					+24	+1/-3	23	+2/-2	+21	+2/-2

Table 6.1: UE Power Classes

NOTE: The tolerance allowed for the nominal maximum output power applies even for the multi-code DPDCH transmission mode.

For the UE which supports DB-DC-HSDPA configuration in Table 6.1aB, the lower side of the tolerance in Table 6.1 is allowed to be adjusted by the amount given in Table 6.1aB for the applicable bands.

DB-DC-HSDPA Configuration	Maximum allowed adjustment in lower side of tolerance (dB)	Applicable bands		
1	-0.3	I, VIII		
2	-1	II, IV		
3	-0.3	I, V		
4	[-1]	I, XI		
5	[-0.3]	II, V		
NOTE: The requirements reflect what can be achieved with the present state of the art technology. They shall be reconsidered when the state of the art technology progresses.				

For the UE which supports dual band 4C-HSDPA configuration in Table 6.1aC, the lower side of the tolerance in Table 6.1 is allowed to be adjusted by the amount given in Table 6.1aC for the applicable bands.

Table 6.1aC Allowed adjustment in lower side of tolerance for UE which supports dual band 4C-HSDPA

Dual Band 4C-HSDPA Configuration		Maximum allowed adjustment in lower side of tolerance (dB)	Applicable bands	
I-2-V	/III-1, I-3-VIII-1	-0.3	I, VIII	
II-1-IV-2, II-2-IV-1, II-2-IV-2		-1	II, IV	
I-1-V-2, I-2-V-1, I-2-V-2		-0.3	I, V	
NOTE: The requirements reflect what can be achieved with the present state of the art technology. They shall be reconsidered when the state of the art technology progresses.				

6.2.2 UE maximum output, power with HS-DPCCH and E-DCH

The Maximum Power Reduction (MPR) for the nominal maximum output power defined in 6.2.1 is specified in table 6.1A for the values of β_c , β_d , β_{hs} , β_{ec} and β_{ed} defined in [8] fully or partially transmitted during a DPCCH timeslot

Table 6.1A: UE maximum output power wit	h HS-DPCCH and E-DCH
---	----------------------

UE transmit channel configuration	CM (dB)	MPR (dB)
For all combinations of; DPDCH, DPCCH, HS- DPCCH, E-DPDCH and E-DPCCH	$0 \le CM \le 3.5$	MAX (CM-1, 0)
Note 1: CM = 1 for β_c/β_d =12/15, β_{hs}/β_c =24/15. F DPCCH, HS-DPCCH, E-DPDCH and E-DF CM difference.		

Where Cubic Metric (CM) is based on the UE transmit channel configuration and is given by

CM = CEIL { $[20 * log10 ((v_norm^3)_{rms}) - 20 * log10 ((v_norm_ref^3)_{rms})] / k, 0.5$ }

Where

- CEIL { x, 0.5 } means rounding upwards to closest 0.5dB, i.e. CM [[0, 0.5, 1.0, 1.5, 2.0, 2.5, 3.0, 3.5]
- k is 1.85 for signals where all channelisations codes meet the following criteria CSF, N where N< SF/2
- k is 1.56 for signals were any channelisations codes meet the following criteria $C_{SF, N}$ where N \ge SF/2
- v_norm is the normalized voltage waveform of the input signal
- v_norm_ref is the normalized voltage waveform of the reference signal (12.2 kbps AMR Speech) and
- $20 * \log 10 ((v_norm_ref^3)_{rms}) = 1.52 \text{ dB}$

6.2.2A UE maximum output, power for DC-HSUPA

The Maximum Power Reduction (MPR) for the nominal maximum output power defined in 6.2.1 is specified in table 6.1AA for the values of β_{c} , β_{d} , β_{hs} , β_{ec} and β_{ed} defined in [8] fully or partially transmitted during a DPCCH timeslot

Table 6.1AA: UE maximum output power for DC-HSUPA

UE transmit channel configuration	CM (dB)	MPR (dB)
For all combinations of; DPCCH, HS-DPCCH, E- DPDCH and E-DPCCH	$0.22 \le CM \le 3.72$	MAX (CM-0.72, 0)

Where Cubic Metric (CM) is based on the UE transmit channel configuration and is given by

CM = CEIL { $[20 * log10 ((v_norm^3)_{rms}) - 20 * log10 ((v_norm_ref^3)_{rms})] / k, 0.22$ }

Where

- CEIL { x, 0.22 } means rounding upwards to closest 0.22dB with 0.5 dB granularity, i.e. CM □ [0.22, 0.72, 1.22, 1.72, 2.22, 2.72, 3.22, 3.72]
- k is 1.66 for DC-HSUPA signals
- v_norm is the normalized voltage waveform of the input signal
- v_norm_ref is the normalized voltage waveform of the reference signal (12.2 kbps AMR Speech) and
- $20 * \log 10 ((v_norm_ref^3)_{rms}) = 1.52 \text{ dB}$

6.2.3 UE Relative code domain power accuracy

The UE Relative code domain power accuracy is a measure of the ability of the UE to correctly set the level of individual code powers relative to the total power of all active codes. When the UE uses 16QAM modulation on any of the uplink code channels the IQ origin offset power shall be removed from the Measured CDP ratio; however, the removed relative IQ origin offset power (relative carrier leakage power) also has to satisfy the applicable requirement. The measure of accuracy is the difference between two dB ratios:

UE Relative CDP accuracy = (Measured CDP ratio) - (Nominal CDP ratio)

where

Measured CDP ratio = $10*\log((\text{Measured code power}) / (\text{Measured total power of all active codes}))$

Nominal CDP ratio = 10*log((Nominal CDP) / (Sum of all nominal CDPs))

The nominal CDP of a code is relative to the total of all codes and is derived from beta factors.

When the UE uses 16QAM modulation a correction factor shall be applied to the β_{ed} value used to compute the Nominal CDP equal to $\{A_1*(0.4472)^2 + A_2*(1.3416)^2 + A_3*(-0.4472)^2 + A_4*(-1.3416)^2\}^{1/2}$ where A_1 , A_2 , A_3 and A_4 are the fractions of symbols (00, 01, 10, 11 respectively) transmitted during the test.

The sum of all nominal CDPs will equal 1 by definition.

NOTE: The above definition of UE relative CDP accuracy is independent of variations in the actual total power of the signal and of noise in the signal that falls on inactive codes.

The required accuracy of the UE relative CDP is given in table 6.1B. The UE relative CDP accuracy shall be maintained over the period during which the total of all active code powers remains unchanged or one timeslot, whichever is the longer.

Nominal CDP ratio	Accuracy (dB)
≥ -10 dB	±1.5
-10 dB to ≥ -15 dB	±2.0
-15 dB ≥ -20 dB	±2.5
-20 dB ≥ -30 dB	±3.0

Table 6.1B: UE Relative CDP accuracy

6.2.3A UE Relative code domain power accuracy for DC-HSUPA

The requirement and corresponding measurements apply to each individual carrier when the total power in each of the assigned carriers is equal to each other

The UE Relative code domain power accuracy is a measure of the ability of the UE to correctly set the level of individual code powers in a carrier relative to the total power of all active codes in that carrier. When the UE uses 16QAM modulation on any of the uplink code channels in a carrier the IQ origin offset power measured in that carrier shall be removed from the Measured CDP ratio in that carrier; however, the removed relative IQ origin offset power (relative carrier leakage power) measured in that carrier also has to satisfy the applicable requirement in that carrier. The measure of accuracy is the difference between two dB ratios measured per carrier configured on the uplink:

UE Relative CDP accuracy = (Measured CDP ratio) - (Nominal CDP ratio)

where

Measured CDP ratio = $10*\log((Measured code power) / (Measured total power of all active codes))$

Nominal CDP ratio = 10*log((Nominal CDP) / (Sum of all nominal CDPs))

The nominal CDP of a code is relative to the total of all codes in each carrier and is derived from beta factors. The sum of all nominal CDPs will equal 1 by definition.

NOTE: The above definition of UE relative CDP accuracy is independent of variations in the actual total power of the signal in each carrier and of noise in the signal that falls on inactive codes.

The required accuracy of the UE relative CDP is given in table 6.1B. The UE relative CDP accuracy shall be maintained over the period during which the total of all active code powers remains unchanged or one timeslot, whichever is the longer.

6.3 Frequency Error

The UE modulated carrier frequency shall be accurate to within ± 0.1 PPM observed over a period of one timeslot compared to the carrier frequency received from the Node B. For the PRACH preambles the measurement interval is lengthened to 3904 chips (being the 4096 chip nominal preamble period less a 25 µs transient period allowance at each end of the burst). These signals will have an apparent error due to Node B frequency error and Doppler shift. The signals from the Node B must be averaged over sufficient time that errors due to noise or interference are within the above ± 0.1 PPM figure. The UE shall use the same frequency source for both RF frequency generation and the chip clock.

6.3A Frequency Error for DC-HSUPA

The UE modulated carrier frequencies shall be accurate to within ± 0.1 PPM observed over a period of one timeslot compared to the average of the carrier frequencies received from the Node B. When the signal from one Node B cell is out-of-sync, the UE modulated carrier frequency shall be compared to the remaining carrier frequency received from the other Node B cell. These signals will have an apparent error due to Node B frequency error and Doppler shift. The signals from the Node B must be averaged over sufficient time such that errors due to noise or interference are within the above ± 0.1 PPM figure. The frequency error of the carrier frequencies received from the Node B shall be the same in average. The UE shall use the same frequency source for both RF frequency generation and the chip clock.

6.4 Output power dynamics

Power control is used to limit the interference level.

6.4.1 Open loop power control

Open loop power control is the ability of the UE transmitter to sets its output power to a specific value. The open loop power control tolerance is given in Table 6.3

6.4.1.1 Minimum requirement

The UE open loop power is defined as the mean power in a timeslot or ON power duration, whichever is available.

Conditions	Tolerance
Normal conditions	± 9 dB
Extreme conditions	± 12 dB

Table 6.3: Open loop power control tolerance

6.4.1.1A Additional requirement for DC-HSUPA

The open loop power control tolerance per carrier is given in Table 6.3.

6.4.2 Inner loop power control in the uplink

Inner loop power control in the Uplink is the ability of the UE transmitter to adjust its output power in accordance with one or more TPC commands received in the downlink.

6.4.2.1 Power control steps

The power control step is the change in the UE transmitter output power in response to a single TPC command, TPC_cmd, derived at the UE.

6.4.2.1.1 Minimum requirement

The UE transmitter shall have the capability of changing the output power with a step size of 1, 2 and 3 dB according to the value of Δ_{TPC} or Δ_{RP-TPC} , in the slot immediately after the TPC_cmd as follows

- a) The transmitter output power step due to inner loop power control shall be within the range shown in Table 6.4.
- b) The transmitter average output power step due to inner loop power control shall be within the range shown in Table 6.5. Here a TPC_cmd group is a set of TPC_cmd values derived from a corresponding sequence of TPC commands of the same duration.

The inner loop power step is defined as the relative power difference between the mean power of the original (reference) timeslot and the mean power of the target timeslot, not including the transient duration. The transient duration is from 25μ s before the slot boundary to 25μ s after the slot boundary.

	Transmitter power control range					
TPC_ cmd	1 dB step size		2 dB step size		3 dB step size	
	Lower	Upper	Lower	Upper	Lower	Upper
+ 1	+0.5 dB	+1.5 dB	+1 dB	+3 dB	+1.5 dB	+4.5 dB
0	-0.5 dB	+0.5 dB	-0.5 dB	+0.5 dB	-0.5 dB	+0.5 dB
-1	-0.5 dB	-1.5 dB	-1 dB	-3 dB	-1.5 dB	-4.5 dB

Table 6.4: Transmitter power control range

TPC_ cmd group	Transmitter power control range after 10 equal TPC_ cmd groups				Transmitter power control range after 7 equal TPC_ cmd groups	
9. • • P	1 dB st	1 dB step size 2 dB step size			3 dB step size	
	Lower	Upper	Lower	Upper	Lower	Upper

Table 6.5: Transmitter aggregate power control range

The UE shall meet the above requirements for inner loop power control over the power range bounded by the Minimum output power as defined in subclause 6.4.3, and the Maximum output power supported by the UE (i.e. the actual power as would be measured assuming no measurement error). This power shall be in the range specified for the power class of the UE in subclause 6.2.1.

6.4.2.1.1A Additional requirement for DC-HSUPA

The UE transmitter shall have the capability of changing the output power in each assigned carrier in the uplink with a step size of 1, 2 and 3 dB according to the value of Δ_{TPC} or Δ_{RP-TPC} , in the slot immediately after the TPC_cmd for the corresponding carrier as follows

- a) The transmitter output power step due to inner loop power control in each assigned carrier in the uplink shall be within the range shown in Table 6.4, when the total transmit power in each of the assigned carriers is equal to each other.
- b) The transmitter average output power step due to inner loop power control in each assigned carrier in the uplink shall be within the range shown in Table 6.5, when the total transmit power in each of the assigned carriers is equal to each other. Here a TPC_cmd group is a set of TPC_cmd values derived from a corresponding sequence of TPC commands of the same duration.
- c) The requirements can be tested by sending the same TPC commands for each of the assigned carriers, assuming that the signal powers for the carriers (in terms of DPCCH code power and total power) have been aligned prior to the beginning of the test procedure.

The inner loop power step is defined as the relative power difference between the mean power of the original (reference) timeslot and the mean power of the target timeslot in each carrier, not including the transient duration. The transient duration is from 25µs before the slot boundary to 25µs after the slot boundary.

6.4.3 Minimum output power

The minimum controlled output power of the UE is when the power is set to a minimum value.

6.4.3.1 Minimum requirement

The minimum output power is defined as the mean power in one time slot. The minimum output power shall be less than -50 dBm.

6.4.3.1A Additional requirement for DC-HSUPA

The minimum output power is defined as the mean power in one time slot in each carrier. The minimum output power in each carrier shall be less than -50 dBm, when both carriers are set to minimum output power.

6.4.4 Out-of-synchronization handling of output power

The receiver characteristics in this section are specified at the antenna connector of the UE. For UE(s) with an integral antenna only, a reference antenna with a gain of 0 dBi is assumed. UE with an integral antenna may be taken into account by converting these power levels into field strength requirements, assuming a 0 dBi gain antenna. For UEs with more than one receiver antenna connector the AWGN signals applied to each receiver antenna connector shall be uncorrelated. The levels of the test signal applied to each of the antenna connectors shall be as defined in section 6.4.4.2 below.

The UE shall monitor the DPCCH quality in order to detect a loss of the signal on Layer 1, as specified in TS 25.214. The thresholds Q_{out} and Q_{in} specify at what DPCCH quality levels the UE shall shut its power off and when it shall turn its power on respectively. The thresholds are not defined explicitly, but are defined by the conditions under which the UE shall shut its transmitter off and turn it on, as stated in this subclause.

The DPCCH quality shall be monitored in the UE and compared to the thresholds Q_{out} and Q_{in} for the purpose of monitoring synchronization. The threshold Q_{out} should correspond to a level of DPCCH quality where no reliable detection of the TPC commands transmitted on the downlink DPCCH can be made. This can be at a TPC command error ratio level of e.g. 30%. The threshold Q_{in} should correspond to a level of DPCCH quality where detection of the TPC commands transmitted on the downlink DPCCH is significantly more reliable than at Q_{out} . This can be at a TPC command error ratio level of e.g. 20%.

6.4.4.1 Minimum requirement

When the UE estimates the DPCCH quality or the quality of the TPC fields of the F-DPCH frame received from the serving HS-DSCH cell over the last 160 ms period or quality of the TPC fields of the F-DPCH from the serving HS-DSCH cell over the previous 240 slots in which the TPC symbols are known to be present when the discontinuous uplink DPCCH transmission operation is enabled to be worse than a threshold Q_{out} , the UE shall shut its transmitter off within 40 ms. The UE shall not turn its transmitter on again until the DPCCH quality exceeds an acceptable level Q_{in} . When the UE estimates the DPCCH quality or the quality of the TPC fields of the F-DPCH frame received from the serving HS-DSCH cell over the last 160 ms period or quality of the TPC fields of the F-DPCH from the serving HS-

DSCH cell over the previous 240 slots in which the TPC symbols are known to be present when the discontinuous uplink DPCCH transmission operation is enabled to be better than a threshold Q_{in} , the UE shall again turn its transmitter on within 40 ms.

The UE transmitter shall be considered "off" if the transmitted power is below the level defined in subclause 6.5.1 (Transmit off power). Otherwise the transmitter shall be considered as "on".

6.4.4.2 Test case

This subclause specifies a test case, which provides additional information for how the minimum requirement should be interpreted for the purpose of conformance testing.

The quality levels at the thresholds Q_{out} and Q_{in} correspond to different signal levels depending on the downlink conditions DCH parameters. For the conditions in Table 6.6, a signal with the quality at the level Q_{out} can be generated by a DPCCH_Ec/Ior ratio of -25 dB, and a signal with Q_{in} by a DPCCH_Ec/Ior ratio of -21 dB. For a UE which supports the optional enhanced performance requirements type1 for DCH a signal with the quality at the level Q_{out} can be instead generated by a DPCCH_Ec/Ior ratio of -28 dB, and a signal with Q_{in} by a DPCCH_Ec/Ior ratio of -24 dB for the conditions in Table 6.6. The DL reference measurement channel (12.2) kbps specified in subclause A.3.1 and with static propagation conditions. The downlink physical channels, other than those specified in Table 6.6, are as specified in Table C.3 of Annex C.

Figure 6.1 shows an example scenario where the DPCCH_Ec/Ior ratio varies from a level where the DPCH is demodulated under normal conditions, down to a level below Q_{out} where the UE shall shut its power off and then back up to a level above Q_{in} where the UE shall turn the power back on. Figure 6.1A shows an example scenario for a UE which supports the optional enhanced performance requirements type1 for DCH, where the DPCCH_Ec/Ior ratio varies from a level where the DPCH is demodulated under normal conditions, down to a level below Q_{out} where the UE shall shut its power off and then back up to a level above Q_{in} where the UE shall turn the power back on.

Parameter	Unit	Value

Information Data Rate	kbps	12.2

Figure 6.1: Test case for out-of-synch handling in the UE

Figure 6.1A: Test case for out-of-synch handling in the UE supporting the enhanced performance requirements type1

In this test case, the requirements for the UE are that:

- 1. The UE shall not shut its transmitter off before point B.
- 2. The UE shall shut its transmitter off before point C, which is $T_{off} = 200$ ms after point B.
- 3. The UE shall not turn its transmitter on between points C and E.
- 4. The UE shall turn its transmitter on before point F, which is $T_{on} = 200$ ms after point E.

6.5 Transmit ON/OFF power

6.5.1 Transmit OFF power

Transmit OFF power is defined as the RRC filtered mean power when the transmitter is off. The transmitter is considered to be off when the UE is not allowed to transmit or during periods when the UE is not transmitting DPCCH due to discontinuous uplink DPCCH transmission. During UL compressed mode gaps, the UE is not considered to be off.

6.5.1.1 Minimum requirement

The transmit OFF power is defined as the RRC filtered mean power in a duration of at least one timeslot excluding any transient periods. The requirement for the transmit OFF power shall be less than -56 dBm.

6.5.1.1A Additional requirement for DC-HSUPA

The transmit OFF power is defined per carrier as the RRC filtered mean power in a duration of at least one timeslot excluding any transient periods. The requirement for the transmit OFF power in each carrier shall be less than -56 dBm, when the transmitters in both carriers are turned off.

6.5.2 Transmit ON/OFF Time mask

The time mask for transmit ON/OFF defines the transient period allowed for the UE between transmit OFF power and transmit ON power. During the transient period there are no additional requirements on UE transmit power beyond what is required in subclause 6.2 maximum output power observed over a period of at least one timeslot. ON/OFF scenarios include PRACH preamble bursts, the beginning or end of PRACH message parts, the beginning or end of each discontinuous uplink DPCCH transmission gap and the beginning or end of UL DPCH transmissions.

6.5.2.1 Minimum requirement

The transmit power levels versus time shall meet the requirements in figure 6.2 for PRACH preambles, the requirements in figure 6.2A for discontinuous uplink DPCCH transmission and the requirements in figure 6.3 for all other cases. The off power observation period is defined as the RRC filtered mean power in a duration of at least one timeslot excluding any transient periods. The on power observation period is defined as the mean power over one timeslot excluding any transient periods. For PRACH preambles, the on power observation period is 3904 chips (4096 chips less the transient periods).

The off power specification in figures 6.2 and 6.3 is as defined in 6.5.1.1.

The average on power specification in figures 6.2 and 6.3 depends on each possible case.

- First preamble of RACH: Open loop accuracy (Table 6.3).
- During preamble ramping of the RACH, and between final RACH preamble and RACH message part: Accuracy depending on size of the required power difference (Table 6.7). The step in total transmitted power between final RACH preamble and RACH message (control part + data part) shall be rounded to the closest integer dB value. A power step exactly half-way between two integer values shall be rounded to the closest integer of greater magnitude.
- After transmission gaps due to discontinuous uplink DPCCH transmission: Accuracy as defined in Table 6.7A. The uplink transmitter power difference tolerance after a transmission gap of up to 10 sub-frames shall be within

the range as defined in Table 6.7A. The TPC_cmd value shown in Table 6.7A corresponds to the last TPC_cmd value received before the transmission gap and applied by the UE after the transmission gap when discontinuous uplink DPCCH transmission is activated.

- After transmission gaps in compressed mode: Accuracy as in Table 6.9.
- Power step to Maximum Power: Maximum power accuracy (Table 6.1).

0	-3 dB	+3 dB	-3 dB	+3 dB	-3 dB	+3 dB
-1	-4 dB	+2 dB	-5 dB	+1 dB	-6 dB	0 dB

6.5.3 Change of TFC

A change of TFC (Transport Format Combination) in uplink means that the power in the uplink varies according to the change in data rate. DTX, where the DPDCH is turned off, is a special case of variable data, which is used to minimise the interference between UE(s) by reducing the UE transmit power when voice, user or control information is not present.

6.5.3.1 Minimum requirement

A change of output power is required when the TFC, and thereby the data rate, is changed. The ratio of the amplitude between the DPDCH codes and the DPCCH code will vary. The power step due to a change in TFC shall be calculated in the UE so that the power transmitted on the DPCCH shall follow the inner loop power control. The step in total transmitted power (DPCCH + DPDCH) shall then be rounded to the closest integer dB value. A power step exactly half-way between two integer values shall be rounded to the closest integer of greater magnitude. The accuracy of the power step, given the step size, is specified in Table 6.8. The power change due to a change in TFC is defined as the relative power difference between the mean power of the original (reference) timeslot and the mean power of the target timeslot, not including the transient duration. The transient duration is from $25\mu s$ before the slot boundary to $25\mu s$ after the slot boundary.

Power step size (Up or down) ∆P [dB]	Transmitter power step tolerance [dB]		
0	+/- 0.5		
1	+/- 0.5		
2	+/- 1.0		
3	+/- 1.5		
4 <u>≤</u> Δ P ≤10	+/- 2.0		
11 <u>≤</u> Δ P ≤15	+/- 3.0		
16 <u>≤</u> Δ P ≤20	+/- 4.0		
21 ≤ Δ P	+/- 6.0		

Table 6.8: Transmitter power step tolerance

The mean power of successive slots shall be calculated according to Figure 6.4.

Figure 6.4: Transmit template during TFC change

6.5.4 Power setting in uplink compressed mode

Compressed mode in uplink means that the power in uplink is changed.

6.5.4.1 Minimum requirement

A change of output power is required during uplink compressed frames since the transmission of data is performed in a shorter interval. The ratio of the amplitude between the DPDCH codes and the DPCCH code will also vary. The power step due to compressed mode shall be calculated in the UE so that the energy transmitted on the pilot bits during each transmitted slot shall follow the inner loop power control.

Thereby, the power during compressed mode, and immediately afterwards, shall be such that the mean power of the DPCCH follows the steps due to inner loop power control combined with additional steps of $10Log_{10}(N_{pilot.prev} / N_{pilot.curr})$ dB where $N_{pilot.prev}$ is the number of pilot bits in the previously transmitted slot, and $N_{pilot.curr}$ is the current number of pilot bits per slot.

The resulting step in total transmitted power (DPCCH +DPDCH) shall then be rounded to the closest integer dB value. A power step exactly half-way between two integer values shall be rounded to the closest integer of greatest magnitude. The accuracy of the power step, given the step size, is specified in Table 6.8 in subclause 6.5.3.1. The power step is defined as the relative power difference between the mean power of the original (reference) timeslot and the mean

power of the target timeslot, when neither the original timeslot nor the reference timeslot are in a transmission gap. The transient duration is not included, and is from 25µs before the slot boundary to 25µs after the slot boundary.

In addition to any power change due to the ratio $N_{pilot,prev} / N_{pilot,curr}$, the mean power of the DPCCH in the first slot after a compressed mode transmission gap shall differ from the mean power of the DPCCH in the last slot before the transmission gap by an amount Δ_{RESUME} , where Δ_{RESUME} is calculated as described in clause 5.1.2.3 of TS 25.214.

The resulting difference in the total transmitted power (DPCCH + DPDCH) shall then be rounded to the closest integer dB value. A power difference exactly half-way between two integer values shall be rounded to the closest integer of greatest magnitude. The accuracy of the resulting difference in the total transmitted power (DPCCH + DPDCH) after a transmission gap of up to 14 slots shall be as specified in Table 6.9.

Transmitter power step Power difference (Up or down) tolerance after a transmission ∆P [dB] gap [dB] $\Delta P \leq 2$ +/- 3 +/- 3 3 +/- 3.5 $4 \le \Delta P \le 10$ +/- 4 $11 \leq \Delta P \leq 15$ +/- 4.5 $16 \leq \Delta P \leq 20$ 21 <u>≤</u> Δ P +/- 6.5

The power difference is defined as the difference between the mean power of the original (reference) timeslot before the transmission gap and the mean power of the target timeslot after the transmission gap, not including the transient durations. The transient durations at the start and end of the transmission gaps are each from 25μ s before the slot boundary to 25μ s after the slot boundary.

The mean power of successive slots shall be calculated according to figure 6.5.

Figure 6.5: Transmit template during compressed mode

6.5.5 HS-DPCCH

The transmission of Ack/Nack or CQI over the HS-DPCCH may cause the transmission power in the uplink to vary. The ratio of the amplitude between the DPCCH and the Ack/Nack and CQI respectively is signalled by higher layers.

6.5.5.1 Minimum requirement

The nominal sum power on DPCCH+DPDCH is independent of the transmission of Ack/Nack and CQI unless the UE output power when Ack/Nack or CQI is transmitted would exceed the maximum value specified in Table 6.1A or fall below the value specified in 6.4.3.1, whereupon the UE shall apply additional scaling to the total transmit power as defined in section 5.1.2.6 of TS.25.214 [8].

The composite transmitted power (DPCCH + DPDCH+HS-DPCCH) may then also be rounded to the closest integer dB value. If rounding is done a power step exactly half-way between two integer values shall be rounded to the closest integer of greater magnitude.

The nominal power step due to transmission of Ack/Nack or CQI is defined as the difference between the nominal mean powers of two power evaluation periods either side of an HS-DPCCH boundary. The first evaluation period starts $25\mu s$ after a DPCCH slot boundary and ends $25\mu s$ before the following HS-DPCCH slot boundary. The second evaluation

period starts 25µs after the same HS-DPCCH slot boundary and ends 25µs before the following DPCCH slot boundary. This is described graphically in figure 6.6.

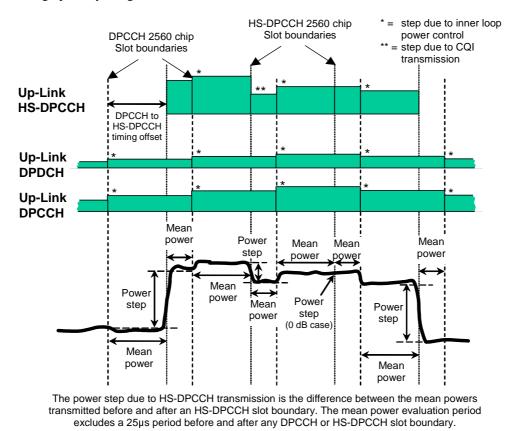

Figure 6.6: Transmit power template during HS-DPCCH transmission

The tolerance of the power step due to transmission of the HS-DPCCH shall meet the requirements in table 6.9A.

Nominal power step size (Up or down) ∆P [dB]	Transmitter power step tolerance [dB]
0	+/- 0.5
1	+/- 0.5
2	+/- 1.0
3	+/- 1.5
$4 \leq \Delta P \leq 7$	+/- 2.0

Table 6.9A: Transmitter power step tolerance

6.6 Output RF spectrum emissions

6.6.1 Occupied bandwidth

Occupied bandwidth is a measure of the bandwidth containing 99 % of the total integrated power of the transmitted spectrum, centered on the assigned channel frequency. The occupied channel bandwidth shall be less than 5 MHz based on a chip rate of 3.84 Mcps.

6.6.1A Occupied bandwidth for DC-HSUPA

In the case dual adjacent carriers are assigned in the uplink, occupied bandwidth is a measure of the bandwidth containing 99 % of the total integrated power of the transmitted spectrum, centered at the center of the assigned channel frequencies. The occupied channel bandwidth shall be less than 10 MHz on a chip rate of 3.84 Mcps.

6.6.2 Out of band emission

Out of band emissions are unwanted emissions immediately outside the nominal channel resulting from the modulation process and non-linearity in the transmitter but excluding spurious emissions. This out of band emission limit is specified in terms of a spectrum emission mask and Adjacent Channel Leakage power Ratio.

6.6.2.1 Spectrum emission mask

The spectrum emission mask of the UE applies to frequencies, which are between 2.5 MHz and 12.5 MHz away from the UE centre carrier frequency. The out of channel emission is specified relative to the RRC filtered mean power of the UE carrier.

6.6.2.1.1 Minimum requirement

The power of any UE emission shall not exceed the levels specified in Table 6.10. The absolute requirement is based on a -50 dBm/3.84 MHz minimum power threshold for the UE. This limit is expressed for the narrower measurement bandwidths as -55.8 dBm/1 MHz and -71.1 dBm/30 kHz. The requirements are applicable for all values of β_c , β_d , β_{hs} , β_{ec} and β_{ed} as specified in [8]. The requirements assume that the UE output power shall be maximum level.

∆f in MHz (Note 1)	Minimum requirement (Note 2)		Measurement bandwidth
	Relative requirement	Absolute requirement	bandwidth
2.5 - 3.5	$\left\{-35 - 15 \cdot \left(\frac{\Delta f}{MHz} - 2.5\right)\right\} dBc$	-71.1 dBm	30 kHz (Note 3)
3.5 - 7.5	$\left\{-35-1\cdot\left(\frac{\Delta f}{MHz}-3.5\right)\right\}dBc$	-55.8 dBm	1 MHz (Note 4)
7.5 - 8.5	$\left\{-39-10\cdot\left(\frac{\Delta f}{MHz}-7.5\right)\right\}dBc$	-55.8 dBm	1 MHz (Note 4)
8.5 - 12.5 MHz	-49 dBc	-55.8 dBm	1 MHz (Note 4)
Note 1: ∆f is the separation between the carrier frequency and the centre of the measurement bandwidth.			measurement
Note 2: The minimum requirement is calculated from the relative requirement or the absolute requirement, whichever is the higher power.			r the absolute
Note 3: The first and	Note 3: The first and last measurement position with a 30 kHz filter is at ∆f equals to 2.515 M and 3.485 MHz.		als to 2.515 MHz
Note 4: The first and 12 MHz.	last measurement position with a 1 MHz	filter is at ∆f equa	als to 4 MHz and

Table 6.10: Spectrum Emission Mask Requirement

For operation in band II, IV, V, X, XII, XIII and XIV the minimum requirement is calculated from the minimum requirement in table 6.10 or the applicable additional requirement in Tables 6.10A, 6.10B or 6.10C, whichever is the tighter requirement.

∆f in MHz (Note 1)	Frequency offset of measurement filter centre frequency, f_offset	Additional requirements Band II, IV, X	Measurement bandwidth
2.5 MHz ≤ ∆f < 3.5 MHz	2.515MHz ≤ f_offset < 3.485MHz	-15 dBm	30 kHz
$3.5 \text{ MHz} \le \Delta f \le 12.5 \text{ MHz}$	$4.0MHz \le f_offset < 12.0 MHz$	-13 dBm	1 MHz
Note 1: Δf is the separation	between the carrier frequency and the	centre of the measurement l	oandwidth.

Table 6.10A: Additional spectrum emission limits for Bands II, IV, X

Table 6.10B: Additional spectrum emission limits for Band V

∆f in MHz (Note 1)	Frequency offset of measurement filter centre frequency, f_offset	Additional requirements Band V	Measurement bandwidth
2.5 MHz ≤ ∆f < 3.5 MHz	2.515MHz ≤ f_offset < 3.485MHz	-15 dBm	30 kHz
$3.5 \text{ MHz} \le \Delta f \le 12.5 \text{ MHz}$	3.55MHz ≤ f_offset < 12.45 MHz	-13 dBm	100 kHz
Note 1: Δf is the separation	between the carrier frequency and the	e centre of the measurement	bandwidth.

Table 6.10C: Additional spectrum emission limits for Bands XII, XIII, XIV

∆f in MHz (Note 1)	Frequency offset of measurement filter centre frequency, f_offset	Additional requirements Band XII, XIII, XIV	Measurement bandwidth
2.5 MHz ≤ ∆f < 2.6 MHz	2.515MHz ≤ f_offset < 2.585MHz	-13 dBm	30 kHz
2.6 MHz ≤ ∆f ≤ 12.45 MHz	2.65MHz ≤ f_offset < 12.45 MHz	-13 dBm	100 kHz
Note 1: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.			

NOTE: As a general rule, the resolution bandwidth of the measuring equipment should be equal to the measurement bandwidth specified in tables 6.10, 6.10A, 6.10B and 6.10C. However, to improve measurement accuracy, sensitivity and efficiency, the resolution bandwidth may be smaller than the measurement bandwidth. When the resolution bandwidth is smaller than the measurement bandwidth, the result should be integrated over the measurement bandwidth in order to obtain the equivalent noise bandwidth of the measurement bandwidth.

6.6.2.1A Additional Spectrum emission mask for DC-HSUPA

The spectrum emission mask of the UE applies to frequencies, which are between 5 MHz and 20 MHz away from the UE centre frequency of the two assigned channel frequencies. The requirements assume that the UE output power shall be maximum level.

6.6.2.1A.1 Minimum requirement

The power of any UE emission shall not exceed the levels specified in Table 6.10D for the specified channel bandwidth.

∆f (MHz)	Spectrum emission limit (dBm)	Measurement bandwidth
± 5-6	-18	30 kHz
± 6-10	-10	1 MHz
± 10-19	-13	1 MHz
± 19-20	-25	1 MHz
Note: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.		

Table 6.10D: Spectrum emission mask for DC-HSUPA

6.6.2.1A.2 Additional requirement for band II, IV, V and X

The UE shall meet an additional requirement specified in Table 6.10E for band II, IV, V and X.

Table 6.10E: Additional spectrum emission mask for DC-HSUPA in band II, IV, V and X

Δf (MHz)	Spectrum emission limit (dBm)	Measurement bandwidth	
± 5-6	-18	30 kHz	
± 6-19	-13	1 MHz	
± 19-20	-25	1 MHz	
Note: Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.			

6.6.2.2 Adjacent Channel Leakage power Ratio (ACLR)

In the case a single carrier is assigned on the uplink, Adjacent Channel Leakage power Ratio (ACLR) is the ratio of the RRC filtered mean power centered on the assigned channel frequency to the RRC filtered mean power centered on an adjacent channel frequency.

In the case dual adjacent carriers are assigned on the uplink, ACLR is the ratio of the sum of the RRC filtered mean power centered on each of the two assigned channel frequencies to the RRC filtered mean powers centered on an adjacent channel frequency.

6.6.2.2.1 Minimum requirement

If the adjacent channel power is greater than -50dBm then the ACLR shall be higher than the value specified in Table 6.11. The requirements are applicable for all values of β_c , β_d , β_{hs} , β_{ec} and β_{ed} as specified in [8].

Power Class	Adjacent channel frequency relative to assigned channel frequency	ACLR limit
3	+ 5 MHz or - 5 MHz	33 dB
3	+ 10 MHz or - 10 MHz	43 dB
4	+ 5 MHz or - 5 MHz	33 dB
4	+ 10 MHz or -10 MHz	43 dB

Table 6.11: UE ACLR

NOTE 1: The requirement shall still be met in the presence of switching transients.

NOTE 2: The ACLR requirements reflect what can be achieved with present state of the art technology.

NOTE 3: Requirement on the UE shall be reconsidered when the state of the art technology progresses.

6.6.2.2.1A Additional requirement for DC-HSUPA

If the adjacent channel power is greater than -50dBm then the ACLR shall be higher than the value specified in Table 6.11A. The requirements are applicable for all values of β_c , β_d , β_{hs} , β_{ec} and β_{ed} as specified in [8].

Power Class	Adjacent channel frequency relative to the center of two assigned channel frequencies	ACLR limit
3	+ 7.5 MHz or – 7.5 MHz	33 dB
3	+ 12.5 MHz or – 12.5 MHz	36 dB
4	+ 7.5 MHz or – 7.5 MHz	33 dB
4	+ 12.5 MHz or -12.5 MHz	36 dB

NOTE 1: The requirement shall still be met in the presence of switching transients.

NOTE 2: The ACLR requirements reflect what can be achieved with present state of the art technology.

NOTE 3: Requirement on the UE shall be reconsidered when the state of the art technology progresses.

6.6.3 Spurious emissions

Spurious emissions are emissions which are caused by unwanted transmitter effects such as harmonics emission, parasitic emission, intermodulation products and frequency conversion products, but exclude out of band emissions.

The frequency boundary and the detailed transitions of the limits between the requirement for out band emissions and spectrum emissions are based on ITU-R Recommendations SM.329 [2].

6.6.3.1 Minimum requirement

These requirements are only applicable for frequencies, which are greater than 12.5 MHz away from the UE centre carrier frequency.

Frequency Bandwidth	Measurement Bandwidth	Minimum requirement
9 kHz ≤ f < 150 kHz	1 kHz	-36 dBm
150 kHz ≤ f < 30 MHz	10 kHz	-36 dBm
30 MHz ≤ f < 1000 MHz	100 kHz	-36 dBm
1 GHz ≤ f < 12.75 GHz	1 MHz	-30 dBm

Note *	The measurements are made on frequencies which are integer multiples of 200 kHz. As
	exceptions, up to five measurements with a level up to the applicable requirements
	defined in Table 6.12 are permitted for each UARFCN used in the measurement
Note **	The measurements are made on frequencies which are integer multiples of 200 kHz. As
	exceptions, measurements with a level up to the applicable requirements defined in Table
	6.12 are permitted for each UARFCN used in the measurement due to 2nd or 3rd
	harmonic spurious emissions
Note ***	This requirement is applicable also for frequencies, which are between 2.5 MHz and 12.5
	MHz away from the UE centre carrier frequency.

6.6.3.1A Additional requirement for DC-HSUPA

The requirements in Table 6.12A are only applicable for frequencies, which are greater than 20 MHz away from the centre of the assigned carrier frequencies when dual adjacent carriers are assigned on the uplink.

Table 6.12A: General spurious emissions requirements for DC-HSUPA

Frequency Bandwidth	Measurement Bandwidth	Minimum requirement
9 kHz ≤ f < 150 kHz	1 kHz	-36 dBm
150 kHz ≤ f < 30 MHz	10 kHz	-36 dBm
30 MHz ≤ f < 1000 MHz	100 kHz	-36 dBm
1 GHz ≤ f < 12.75 GHz	1 MHz	-30 dBm

The requirements in Table 6.13A are only applicable for frequencies, which are greater than 25 MHz away from the centre of the assigned frequencies when dual adjacent carriers are assigned on the uplink.

# 6.7 Transmit intermodulation

The transmit intermodulation performance is a measure of the capability of the transmitter to inhibit the generation of signals in its non linear elements caused by presence of the wanted signal and an interfering signal reaching the transmitter via the antenna.

# 6.7.1 Minimum requirement

User Equipment(s) transmitting in close vicinity of each other can produce intermodulation products, which can fall into the UE, or Node B receive band as an unwanted interfering signal. The UE intermodulation attenuation is defined by the ratio of the RRC filtered mean power of the wanted signal to the RRC filtered mean power of the intermodulation product when an interfering CW signal is added at a level below the wanted signal.

The requirement of transmitting intermodulation for a carrier spacing of 5 MHz is prescribed in Table 6.14.

Table 6.14: Transmit Intermodulation

Interference Signal Frequency Offset	5MHz	10MHz
Interference CW Signal Level -40dBc		0dBc
Intermodulation Product	-31dBc	-41dBc

# 6.7.1A Additional requirement for DC-HSUPA

The UE intermodulation attenuation is defined by the ratio of the sum of the RRC filtered mean powers of the wanted signal on the assigned carriers to the sum of the RRC filtered mean powers of the intermodulation product on two adjacent carriers when an interfering CW signal is added at a level below the wanted signal.

The requirement of transmitting intermodulation for a carrier spacing of 5 MHz is prescribed in Table 6.14A.

### Table 6.14A: Transmit Intermodulation requirement for DC-HSUPA

Interference Signal Frequency Offset	10MHz	20MHz
Interference CW Signal Level	-40	0dBc
Intermodulation Product	-31dBc	-41dBc

# 6.8 Transmit modulation

Transmit modulation defines the modulation quality for expected in-channel RF transmissions from the UE. The requirements apply to all transmissions including the PRACH pre-amble and message parts and all other expected transmissions. In cases where the mean power of the RF signal is allowed to change versus time e.g. PRACH, DPCH in compressed mode, change of TFC, inner loop power control and for HSDPA transmissions with non-constant HS-DPCCH code power, the EVM, Peak Code Domain Error and E-DCH Code Domain Error requirements do not apply during the 25 us period before and after the nominal time when the mean power is expected to change.

# 6.8.1 Transmit pulse shape filter

The transmit pulse shaping filter is a root-raised cosine (RRC) with roll-off  $\alpha$  =0.22 in the frequency domain. The impulse response of the chip impulse filter  $RC_0(t)$  is:

$$RC_{0}(t) = \frac{\sin\left(\pi \frac{t}{T_{c}}(1-\alpha)\right) + 4\alpha \frac{t}{T_{c}}\cos\left(\pi \frac{t}{T_{c}}(1+\alpha)\right)}{\pi \frac{t}{T_{c}}\left(1-\left(4\alpha \frac{t}{T_{c}}\right)^{2}\right)}$$

Where the roll-off factor  $\alpha = 0.22$  and the chip duration is

$$T = \frac{1}{chiprate} \approx 0.26042 \ \mu s$$

## 6.8.2 Error Vector Magnitude

The Error Vector Magnitude is a measure of the difference between the reference waveform and the measured waveform. This difference is called the error vector. Both waveforms pass through a matched Root Raised Cosine filter with bandwidth 3,84 MHz and roll-off  $\alpha$ =0,22. Both waveforms are then further modified by selecting the frequency, absolute phase, absolute amplitude and chip clock timing so as to minimise the error vector. The EVM result is defined as the square root of the ratio of the mean error vector power to the mean reference power expressed as a %. The measurement interval is one timeslot except when the mean power between slots is expected to change whereupon the measurement interval is reduced by 25 µs at each end of the slot. For the PRACH preamble the measurement interval is 4096 chips less 25 µs at each end of the burst (3904 chips).

When the UE uses 16QAM modulation on any of the uplink code channels in a carrier, the error minimization step also includes selecting an IQ origin offset besides selecting the frequency, absolute phase, absolute amplitude and chip clock timing to minimise the error vector. The IQ origin offset shall be removed from the evaluated signal before calculating the EVM; however, the removed relative IQ origin offset power (relative carrier leakage power) also has to satisfy the applicable requirement.

For signals containing more than one spreading code in a carrier where the slot alignment of the codes is not the same and the code power is varying, the period over which the nominal mean power in that carrier remains constant can be less than one timeslot. For such time-varying signals it is not possible to define EVM across one timeslot since this interval contains an expected change in mean power, and the exact timing and trajectory of the power change is not defined. For these signals, the EVM minimum requirements apply only for intervals of at least one half timeslot (less any 25µs transient periods) during which the nominal code power of each individual code is constant.

NOTE: The reason for setting a lower limit for the EVM measurement interval is that for any given impaired signal, the EVM would be expected to improve for measurement intervals less than one timeslot while the frequency error would be expected to degrade.

### 6.8.2.1 Minimum requirement

When 16QAM modulation is not used on any of the uplink code channels, the Error Vector Magnitude shall not exceed 17.5 % for the parameters specified in Table 6.15.

When 16QAM modulation is used on any of the uplink code channels, the modulation accuracy requirement shall meet one or both of the following requirements:

- 1. The Error Vector Magnitude does not exceed 14 % for the parameters specified in Table 6.15.
- 2. The Relative Code Domain Error requirements specified in 6.8.3a are met.

The requirements are applicable for all values of  $\beta_c$ ,  $\beta_d$ ,  $\beta_{hs}$ ,  $\beta_{ec}$  and  $\beta_{ed}$  as specified in [8].

Parameter		Unit	Level
UE Output Power, no 16QAM		dBm	≥ -20
UE Output Power	, 16QAM	dBm	≥ -30
Operating conditions			Normal conditions
Power control step size		dB	1
Measurement	PRACH		3904
		From 1280 to 2560 (Note 2)	
Note 1: Less any 25µs transient periods Note 2: The longest period over which the nominal power remains constant			

Table 6.15: Parameters for Error Vector Magnitude/Peak Code Domain Error

When 16QAM modulation is used on any of the uplink code channels, the relative carrier leakage power (IQ origin offset power) shall not exceed the values specified in Table 6.15a

Table 6.15a: Relative	e Carrier	Leakage	Power
-----------------------	-----------	---------	-------

UE Transmitted Mean	Relative Carrier Leakage Power
Power	(dB)
P ≥ -30 dBm	< -17

#### 6.8.2.1A Additional requirement for DC-HSUPA

When 16QAM modulation is not used on any of the uplink code channels in a carrier, the Error Vector Magnitude in that carrier shall not exceed 17.5 % for the parameters specified in Table 6.15AA.

When 16QAM modulation is used on any of the uplink code channels in a carrier, the modulation accuracy requirement shall meet one or both of the following requirements:

- 1. The Error Vector Magnitude does not exceed 14 % for the parameters specified in Table 6.15AA.
- 2. The Relative Code Domain Error requirements specified in 6.8.3a are met.

The requirements are applicable for all values of  $\beta_c$ ,  $\beta_d$ ,  $\beta_{hs}$ ,  $\beta_{ec}$  and  $\beta_{ed}$  as specified in [8], when the total power in each of the assigned carriers is equal to each other.

Table 6.15AA: Parameters for Error Vect	tor Magnitude for DC-HSUPA
-----------------------------------------	----------------------------

Parameter	Unit	Level
UE Output Power, no 16QAM	dBm	≥ -20
UE Output Power, 16QAM	dBm	≥ -30
Operating conditions		Normal conditions
Power control step size	dB	1

#### 6.8.3 Peak code domain error

The Peak Code Domain Error is computed by projecting power of the error vector (as defined in 6.8.2) onto the code domain at a specific spreading factor. The Code Domain Error for every code in the domain is defined as the ratio of the mean power of the projection onto that code, to the mean power of the composite reference waveform. This ratio is expressed in dB. The Peak Code Domain Error is defined as the maximum value for the Code Domain Error for all codes. The measurement interval is one timeslot except when the mean power between slots is expected to change whereupon the measurement interval is reduced by 25 µs at each end of the slot.

The requirement for peak code domain error is only applicable for multi-code DPDCH transmission and therefore does not apply for the PRACH preamble and message parts.

### 6.8.3.1 Minimum requirement

The peak code domain error shall not exceed -15 dB at spreading factor 4 for the parameters specified in Table 6.15. The requirements are defined using the UL reference measurement channel specified in subclause A.2.5.

### 6.8.3a Relative code domain error

### 6.8.3a.1 Relative Code Domain Error

The Relative Code Domain Error is computed by projecting the error vector (as defined in 6.8.2) onto the code domain. Only the code channels with non-zero betas in the composite reference waveform are considered for this requirement. The Relative Code Domain Error for every non-zero beta code in the domain is defined as the ratio of the mean power of the projection onto that non-zero beta code, to the mean power of the non-zero beta code in the composite reference waveform. This ratio is expressed in dB. The measurement interval is one timeslot except when the mean power between slots is expected to change whereupon the measurement interval is reduced by 25 µs at each end of the slot.

In the mode of DC-HSUPA, the requirement and corresponding measurements apply to each individual carrier when the total power in each of the assigned carriers is equal to each other.

The Relative Code Domain Error is affected by both the spreading factor and beta value of the various code channels in the domain. The Effective Code Domain Power (ECDP) is defined to capture both considerations into one parameter. It uses the Nominal CDP ratio (as defined in 6.2.3), and is defined as follows for each used code, k, in the domain:

 $ECDP_k = (Nominal CDP ratio)_k + 10*log10(SF_k/256)$ 

When 16QAM is not used on any of the UL code channels in a carrier, the requirements for Relative Code Domain Error are not applicable when either or both the following channel combinations occur:

- when the ECDP of any code channel is < -30dB
- when the nominal code domain power of any code channel is < -20 dB

When 16QAM is used on any of the UL code channels in a carrier, the requirements for Relative Code Domain Error are not applicable when either or both the following channel combinations occur:

- when the ECDP of any code channel is < -30dB
- when the nominal code domain power of any code channel is < -30 dB

The requirement for Relative Code Domain Error also does not apply for the PRACH preamble and message parts.

### 6.8.3a.1.1 Minimum requirement

When 16QAM is not used on any of the UL code channels, the Relative Code Domain Error shall meet the requirements in Table 6.15B for the parameters specified in Table 6.15

### Table 6.15B: Relative Code Domain Error minimum requirement

ECDP dB	Relative Code Domain Error dB
-21 < ECDP	≤ -16
-30 ≤ ECDP ≤ -21	≤ -37 – ECDP
ECDP < -30	No requirement

When 16QAM is used on any of the UL code channels, the Relative Code Domain Error of the codes not using 16QAM shall meet the requirements in Table 6.15C for the parameters specified in Table 6.15.

ECDP dB	Relative Code Domain Error dB	
-22 < ECDP	≤ -18	
-30 ≤ ECDP ≤ -22	≤ -40 – ECDP	
ECDP < -30	No requirement	

Table 6.15C: Relative Code Domain Error minimum requirement

When 16QAM is used on any of the UL code channels, the Nominal CDP Ratio-weighted average of the Relative Code Domain Errors measured individually on each of the codes using 16QAM shall meet the requirements in Table 6.15D for the parameters specified in Table 6.15. The Nominal CDP Ratio-weighted average of the Relative Code Domain Errors means the sum  $\sum_{i=1}^{N} 10^{(\text{Nominal CDP ratio})_k/10} \cdot 10^{(\text{Relative Code Domain Error})_k/10}$  over all code k that uses 16QAM.

For the purposes of evaluating the requirements specified in Table 6.15D, the ECDP value is determined as the minimum of the individual ECDP values corresponding to the codes using 16QAM.

### Table 6.15D: Relative Code Domain Error minimum requirement

ECDP dB	Average Relative Code Domain Error dB
-25.5 < ECDP	≤ -18
-30 ≤ ECDP ≤ -25.5	≤ -43.5 – ECDP
ECDP < -30	No requirement

### 6.8.3a.1.1a Additional requirement for DC-HSUPA

When 16QAM is not used on any of the UL code channels in a carrier, the Relative Code Domain Error in that carrier shall meet the requirements in Table 6.15B for the parameters specified in Table 6.15AA.

When 16QAM is used on any of the UL code channels in a carrier, the Relative Code Domain Error of the codes not using 16QAM in that carrier shall meet the requirements in Table 6.15C for the parameters specified in Table 6.15AA.

When 16QAM is used on any of the UL code channels in a carrier, the Nominal CDP Ratio-weighted average of the Relative Code Domain Errors measured individually on each of the codes using 16QAM in that carrier shall meet the requirements in Table 6.15D for the parameters specified in Table 6.15AA.

For the purposes of evaluating the requirements specified in Table 6.15D, the ECDP value is determined as the minimum of the individual ECDP values corresponding to the codes using 16QAM.

## 6.8.3b In-band emission for DC-HSUPA

The in-band emission is measured as the ratio of the UE output power in one carrier in dual cells to the UE output power in the other carrier, where the power in the former carrier shall be set to the minimum output power and the power in the latter carrier to the maximum output power. The basic in-band emission measurement interval is defined over one slot in the time domain.

### 6.8.3b.1 Minimum requirement for DC-HSUPA

The in-band emission shall not exceed the value specified in Table 6.15E.

Parameter Description		Unit	Limit
In-band emission dBc -24			
Note : The measurement bandwidth is 3.84 MHz centered on each carrier frequency and the limit is expressed as a ratio of RRC filtered mean power in one carrier, transmitting at minimum output power, to the RRC filtered mean power in the other carrier, transmitting at maximum output power.			power in one carrier,

# 6.8.4 Phase discontinuity for uplink DPCH

Phase discontinuity is the change in phase between any two adjacent timeslots. The EVM for each timeslot (excluding the transient periods of 25  $\mu$ s on either side of the nominal timeslot boundaries), shall be measured according to subclause 6.8.2. The frequency, absolute phase, absolute amplitude and chip clock timing used to minimise the error vector are chosen independently for each timeslot. The phase discontinuity result is defined as the difference between the absolute phase used to calculate EVM for the preceding timeslot, and the absolute phase used to calculate EVM for the succeeding timeslot.

### 6.8.4.1 Minimum requirement

The rate of occurrence of any phase discontinuity on an uplink DPCH for the parameters specified in table 6.16 shall not exceed the values specified in table 6.17. Phase shifts that are caused by changes of the UL transport format combination (TFC), compressed mode and HS-DPCCH are not included. When calculating the phase discontinuity, the requirements for frequency error and EVM in subclauses 6.3 and 6.8.2 for each timeslot shall be met.

### Table 6.16: Parameters for Phase discontinuity

Parameter	Unit	Level
Power control step size	dB	1

Table 6.17: Phase	discontinuity	y minimum	requirement
-------------------	---------------	-----------	-------------

Phase discontinuity Δθ in degrees	Maximum allowed rate of occurrence in Hz
$\Delta \theta \leq 30$	1500
$30 < \Delta \theta \le 60$	300
$\Delta \theta > 60$	0

# 6.8.5 Phase discontinuity for HS-DPCCH

Phase discontinuity for HS-DPCCH is the change in phase due to the transmission of the HS-DPCCH. In the case where the HS-DPCCH timeslot is offset from the DPCCH timeslot, the period of evaluation of the phase discontinuity shall be the DPCCH timeslot that contains the HS-DPCCH slot boundary. The phase discontinuity for HS-DPCCH result is defined as the difference between the absolute phase used to calculate the EVM for that part of the DPCCH timeslot prior to the HS-DPCCH slot boundary, and the absolute phase used to calculate the EVM for remaining part of the DPCCH timeslot following the HS-DPCCH slot boundary. In all cases the subslot EVM is measured excluding the transient periods of 25  $\mu$ s.

Since subslot EVM is only defined for intervals of at least one half timeslot, the phase discontinuity for HS-DPCCH is only defined for non-aligned timeslots when the offset is 0.5 slots.

### 6.8.5.1 Minimum requirement

The phase discontinuity for HS-DPCCH shall not exceed the value specified in table 6.18 90% of the time. When calculating the phase discontinuity, the requirements for frequency error and EVM in sub clauses 6.3 and 6.8.2, respectively shall be met.

### Table 6.18: Phase discontinuity minimum requirement for HS-DPCCH at HS-DPCCH slot boundary

Phase discontinuity for	
HS-DPCCH Δθ in	$\Delta \theta \leq 30$
degrees	

# 6.8.6 Phase discontinuity for E-DCH

Phase discontinuity for E-DCH is the change in phase due to the transmission of DPCCH, HS-DPCCH, E-DPCCH and E-DCH with the combined transmit power profile as defined in Table 6.19. The phase discontinuity for E-DCH result is

defined as the difference between the absolute phase used to calculate the EVM for the preceding timeslot, and the absolute phase used to calculate the EVM for the succeeding timeslot.

Note 3: The total combined power profile has a period of 72 slots and will be repeated every 72 slots.			
Note 4:			

Table 6.19 Transmit power profile for E-DCH phase discontinuity test

### 6.8.6.1 Minimum requirement

When transmitting according to the power profile specified in Table 6.19, the phase discontinuity for E-DCH shall not exceed the value specified in table 6.20 for the specified amount of time in table 6.20. The requirement applies for the range of DPCCH powers according to table 6.20. When calculating the phase discontinuity, the requirements for frequency error and EVM in sub clauses 6.3 and 6.8.2, respectively shall be met.

Phase discontinuity Δθ in degrees	Minimum allowed time in percentage	DPCCH power in dBm
$\Delta \theta \leq 15$	80	
$\Delta \theta \leq 35$	90	-15 $\leq$ DPCCH power $\leq$ (P _{max} -20)
$\Delta \theta \leq 45$	100	

Table 6.20: Phase discontinuity minimum requirement for E-DCH

# 6.8.7 Time alignment error for DC-HSUPA

In DC-HSUPA transmission, signals are transmitted for dual cells. These signals shall be aligned. The time alignment error in DC-HSUPA transmission is specified as the delay between the signals from primary and secondary uplink frequencies at the antenna port.

### 6.8.7.1 Minimum requirement

The time alignment error shall not exceed ³/₄ Tc.

# 7 Receiver characteristics

# 7.1 General

Unless otherwise stated the receiver characteristics are specified at the antenna connector of the UE. For UE(s) with an integral antenna only, a reference antenna with a gain of 0 dBi is assumed. UE with an integral antenna may be taken into account by converting these power levels into field strength requirements, assuming a 0 dBi gain antenna. For UEs with more than one receiver antenna connector the AWGN signals applied to each receiver antenna connector shall be uncorrelated. The levels of the test signal applied to each of the antenna connectors shall be as defined in the respective sections below.

The UE antenna performance has a significant impact on system performance, and minimum requirements on the antenna efficiency are therefore intended to be included in future versions of the present document. It is recognised that different requirements and test methods are likely to be required for the different types of UE.

UEs supporting DC-HSDPA, regardless of MIMO configuration, shall support both minimum requirements, as well as additional requirements for DC-HSDPA.

UEs supporting DB-DC-HSDPA shall support both minimum requirements as well as additional requirements for DB-DC-HSDPA.

UEs supporting DC-HSUPA shall support both minimum requirements, as well as additional requirements for DC-HSUPA.

UEs supporting single band 4C-HSDPA shall support minimum requirements, additional requirements for DC-HSDPA as well as additional requirements for single band 4C-HSDPA.

UEs supporting dual band 4C-HSDPA shall support minimum requirements, additional requirements for DC-HSDPA, additional requirements for DB-DC-HSDPA as well as additional requirements for dual band 4C-HSDPA.

For minimum requirements, all the parameters in clause 7 are defined using the DL reference measurement channel (12.2 kbps) specified in subclause A.3.1 and unless otherwise stated with DL power control OFF.

For the additional requirements for DC-HSDPA, DB-DC-HSDPA, DC-HSUPAor single band/dual band 4C-HSDPA, all the parameters in clause 7 are defined using the DL reference measurement channel H-Set 12, specified in subclause A.7.1.12 and the downlink physical channel setup according to table C.12C.

For the additional requirements for DC-HSDPA, the spacing of the carrier frequencies of the two cells in downlink shall be 5 MHz, and it is assumed that the UE is configured with a single uplink carrier frequency.

For the additional requirements for DC-HSUPA, the spacing of the carrier frequencies of the two cells in both downlink and uplink shall be 5 MHz.

For the additional requirements for single band/dual band 4C-HSDPA, the spacing of the adjacent carrier frequencies in downlink and uplink shall be 5 MHz.

For each single band/dual band 4C-HSDPA configuration, the UL-DL carrier separation is defined as minimum (maximum) when the UL carrier is placed at minimum (maximum) possible distance in frequency from the closest carrier in the corresponding DL band for which the requirement applies.

The requirements specified in Section 7 in general could be different for each single band/dual band 4C-HSDPA configuration within the same operating band(s).

# 7.2 Diversity characteristics

A suitable receiver structure using coherent reception in both channel impulse response estimation and code tracking procedures is assumed. Three forms of diversity are considered to be available in UTRA/FDD.

Table 7.1: Diversity	characteristics	for UTRA/FDD
----------------------	-----------------	--------------

Time diversity	Channel coding and interleaving in both up link and down link
Multi-path diversity	Rake receiver or other suitable receiver structure with maximum combining. Additional processing elements can increase the delay-spread performance due to increased capture of signal energy.
Antenna diversity	Antenna diversity with maximum ratio combing in the Node B and optionally in the UE. Possibility for downlink transmit diversity in the Node B.

# 7.3 Reference sensitivity level

The reference sensitivity level <REFSENS> is the minimum mean power received at the UE antenna port at which the specified minimum requirement shall be met.

# 7.3.1 Minimum requirement

The BER shall not exceed 0.001 for the parameters specified in Table 7.2.

Operating Band		Unit	DPCH_Ec <refsens></refsens>	<refî<sub>or&gt;</refî<sub>

II-1-IV-2 II-2-IV-1 II-2-IV-2	1	II, IV

# 7.3.2 Additional requirement for DC-HSDPA

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.2A.

Note: The reference sensitivity level <REFSENS> requirement for DC-HSDPA is not applicable for dual uplink operation. However, there might be a substantial Rx de-sensitization for the UE operating in bands which have less than 80 MHz Tx-Rx frequency separation, transmitting on more than one uplink frequency, at maximum power.

	V	V	dBm/3.84 MHz	[-111]	[-100.7]
NOTE 1 For Power class 3 and 3bis this shall be at the maximum output power NOTE 2 For Power class 4 this shall be at the maximum output power					

### Table 7.2B: Test parameters for reference sensitivity, additional requirement for DB-DC-HSDPA.

# 7.3.4 Additional requirement for single band 4C-HSDPA

For all requirements listed in Table 7.2C, corresponding to the specific single band 4C-HSDPA configuration(s) supported by the UE, (see Table 5.0aB), the BLER measured on each individual cell shall not exceed 0.1.

Note: The reference sensitivity level <REFSENS> requirement for single band 4C-HSDPA is not applicable for dual uplink operation. However, there might be a substantial Rx de-sensitization for the UE operating in bands which have less than 80 MHz Tx-Rx frequency separation, transmitting on more than one uplink frequency, at maximum power.

 Table 7.2C: Test parameters for reference sensitivity, additional requirement for single band 4C-HSDPA.

Single band 4C-HSDPA configuration	DL Band	Unit	HS-PDSCH_Ec <refsens></refsens>	<refî<sub>or&gt;</refî<sub>	UL-DL carrier separation
I-3	I	dBm/3.84 MHz	-113	-102.7	Minimum
NOTE 1 For Power class 3, 3bis and 4, this shall be at the maximum output power					

# 7.3.5 Additional requirement for dual band 4C-HSDPA

For all requirements listed in Table 7.2D, corresponding to the specific dual band 4C-HSDPA configuration(s) supported by the UE, (see Table 5.0aC), the BLER measured on each individual cell shall not exceed 0.1.

Note: The reference sensitivity level <REFSENS> requirement for dual band 4C-HSDPA is not applicable for dual uplink operation. However, there might be a substantial Rx de-sensitization for the UE operating in bands which have less than 80 MHz Tx-Rx frequency separation, transmitting on more than one uplink frequency, at maximum power.

Table 7.2D: Test parameters for reference sensitivity, additional requirement for dual band 4C-
HSDPA.

# 7.4 Maximum input level

This is defined as the maximum mean power received at the UE antenna port, at which the specified BER performance shall be met.

# 7.4.1 Minimum requirement for DPCH reception

The BER shall not exceed 0.001 for the parameters specified in Table 7.3.

Parameter	Unit	Level
$\frac{DPCH_Ec}{I_{or}}$	dB	-19
Î _{or}	dBm/3.84 MHz	-25
UE transmitted mean power	dBm	20 (for Power class 3 and 3bis) 18 (for Power class 4)

 Table 7.3: Maximum input level

NOTE: Since the spreading factor is large (10log(SF)=21dB), the majority of the total input signal consists of the OCNS interference. The structure of OCNS signal is defined in Annex C.3.2.

# 7.4.2 Minimum requirement for HS-PDSCH reception

### 7.4.2.1 Minimum requirement for 16QAM

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channel H-Set 1 (16QAM version) specified in Annex A.7.1.1 with the addition of the parameters in Table 7.3A and the downlink physical channel setup according to table C.8.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 7.3B.

Parameter	Unit	Value
Phase reference		P-CPICH
Î _{or}	dBm/3.84 MHz	-25
UE transmitted mean power	dBm	20 (for Power class 3 and 3bis) 18 (for Power class 4)
DPCH_Ec/lor	dB	-13
HS-SCCH_1_Ec/lor	dB	-13
Redundancy and constellation version		6
Maximum number of HARQ transmissions		1
Note: The HS-SCCH and corresponding HS-PDSCH shall be transmitted continuously with constant power but the HS-SCCH shall only use the identity of the UE under test every third TTI

# 7.4.3 Additional requirement for DC-HSDPA and DB-DC-HSDPA

### 7.4.3.1 Additional requirement for 16QAM

The additional requirements are specified in terms of a minimum information throughput per cell R with the DL reference channel H-Set 1 (16QAM version) specified in Annex A7.1.1, with the addition of the parameters in Table 7.3E, and the downlink physical channel setup according to table C.8, applied to both cells simultaneously. Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 7.3F.

Parameter	Unit	Value
Phase reference		P-CPICH
Î _{or}	dBm/3.84 MHz	-25
UE transmitted mean power	dBm	20 (for Power class 3 and 3bis) 18 (for Power class 4)

Maximum number of HARQ transmissions 1		
Note 1:The HS-SCCH and corresponding HS-PDSCH shall be transmitted continuously with constant power but the HS-SCCH shall only use the identity of the UE under test every third TTINote 2:Wanted signal mean power per band is the sum of measured mean power on each carrier in a band over 3.84 MHz.		

Table 7.3L	Minimum	requirement
------------	---------	-------------

<b>HS-PDSCH</b> $E_c/I_{or}$ (dB)	T-put <i>R</i> (kbps)	
-2	11800	

# 7.5 Adjacent Channel Selectivity (ACS)

Adjacent Channel Selectivity (ACS) is a measure of a receiver"s ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an adjacent channel signal at a given frequency offset from the centre frequency of

the assigned channel. ACS is the ratio of the receive filter attenuation on the assigned channel frequency to the receive filter attenuation on the adjacent channel(s).

## 7.5.1 Minimum requirement

The UE shall fulfill the minimum requirement specified in Table 7.4 for all values of an adjacent channel interferer up to -25 dBm.

However it is not possible to directly measure the ACS, instead the lower and upper range of test parameters are chosen in Table 7.5 where the BER shall not exceed 0.001.

Table 7.4:	Adjacent	Channel	Selectivity
------------	----------	---------	-------------

Unit	ACS
dB	33

Parameter	Unit	Case 1	Case 2
DPCH_Ec	dBm/3.84 MHz	<refsens> + 14 dB</refsens>	<refsens> + 41 dB</refsens>
Î _{or}	dBm/3.84 MHz	<refî<sub>or&gt; + 14 dB</refî<sub>	REFÎ _{or} > + 41 dB
loac mean power (modulated)	dBm	-52	-25
F _{uw} (offset)	MHz	+5 or -5	+5 or -5
		20 (for Power class 3 and	20 (for Power class 3
UE transmitted mean power	dBm	3bis)	and 3bis)
		18 (for Power class 4)	18 (for Power class 4)

- NOTE 1: The I_{oac} (modulated) signal consists of the common channels needed for tests as specified in Table C.7 and 16 dedicated data channels as specified in Table C.6.
- NOTE 2: <REFSENS> and <REF $\hat{I}_{or}$ > refers to the DPCH_Ec<REFSENS> and the DPCH<REF $\hat{I}_{or}$ > as specified in Table 7.2.

# 7.5.2 Additional requirement for DC-HSDPA and DB-DC-HSDPA

The UE shall fulfill the additional requirement specified in Table 7.5A for all values of an adjacent channel interferer up to -25 dBm.

However it is not possible to directly measure the ACS, instead the lower and upper range of test parameters are chosen in Table 7.5B, where the HS-PDSCH BLER shall not exceed 0.1.

### Table 7.5A: Adjacent Channel Selectivity

ACS
33

Parameter	Unit	Case 1	Case 2
HS-PDSCH_Ec	dBm/3.84 MHz	<refsens> + 14 dB</refsens>	<refsens> + 41 dB</refsens>
Î _{or}	dBm/3.84 MHz	<refî<sub>or&gt; + 14 dB</refî<sub>	<refî<sub>or&gt; + 41 dB</refî<sub>
loac mean power (modulated)	dBm	-52	-25
F _{uw} (offset) (NOTE 2)	MHz	+5 or -5	+5 or -5
UE transmitted mean power	dBm	20 (for Power class 3 and 3bis) 18 (for Power class 4)	20 (for Power class 3 and 3bis) 18 (for Power class 4)

NOTE 1: The I_{oac} (modulated) signal consists of the common channels needed for tests as specified in Table C.7 and 16 dedicated data channels as specified in Table C.6.

- NOTE 2: For DC-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency used and positive offset refers to the assigned channel frequency of the highest carrier frequency used. For DB-DC-HSDPA, offset refers to the assigned channel frequencies of the individual cells.
- NOTE 3:  $\langle \text{REFSENS} \rangle$  and  $\langle \text{REFI}_{or} \rangle$  refers to the HS-PDSCH_Ec $\langle \text{REFSENS} \rangle$  and the HS-PDSCH $\langle \text{REFI}_{or} \rangle$  as specified in Table 7.2A for DC-HSDPA and Table 7.2B for DB-DC-HSDPA.

# 7.5.3 Additional requirement for single band/dual band 4C-HSDPA

The UE shall fulfill the additional requirement specified in Table 7.5C for all values of an adjacent channel interferer up to -25 dBm.

However it is not possible to directly measure the ACS, instead the lower and upper range of test parameters are chosen in Table 7.5D and the requirements are given in Table 7.5E for single band 4C-HSDPA and in 7.5F and 7.5G for dual band 4C-HSDPA, where the HS-PDSCH BLER shall not exceed 0.1.

The ACS requirement for single band/dual-band 4C-HSDPA is not applicable for dual uplink operation.

Table 7.5C:	Adjacent	Channel	Selectivity
-------------	----------	---------	-------------

Rx Parameter	Unit	Number of adjacent downlink carriers in a band				
		1	2	3	4	
ACS	dB	33	33	33	33	

Parameter	Unit	Case 1	Case 2
Ioac mean power (modulated)	dBm	-52	-25
F _{uw} (offset) (NOTE 2)	MHz	+5 or -5	+5 or -5
UE transmitted mean power	dBm	20 (for Power c 18 (for Pov	

#### Table 7.5D: Test parameters for Adjacent Channel Selectivity

- NOTE 1: The I_{oac} (modulated) signal consists of the common channels needed for tests as specified in Table C.7 and 16 dedicated data channels as specified in Table C.6.
- NOTE 2: Negative offset refers to the assigned channel frequency of the lowest carrier frequenc(ies) in each band, and positive offset refers to the assigned channel frequency of the highest carrier frequenc(ies) in each band.

### Table 7.5E: Single band 4C-HSDPA requirements for Adjacent Channel Selectivity

1-2-0-2	V	v	<refsens>+41 dB</refsens>	<refî<sub>or&gt;+41 dB</refî<sub>	Minimum

NOTE:  $\langle \text{REFSENS} \rangle$  and  $\langle \text{REFI}_{or} \rangle$  refers to the HS-PDSCH_Ec $\langle \text{REFSENS} \rangle$  and the HS-PDSCH $\langle \text{REFI}_{or} \rangle$  as specified in Table 7.2D for dual band 4C-HSDPA.

# 7.6 Blocking characteristics

The blocking characteristic is a measure of the receiver's ability to receive a wanted signal at its assigned channel frequency in the presence of an unwanted interferer on frequencies other than those of the spurious response or the adjacent channels, without this unwanted input signal causing a degradation of the performance of the receiver beyond a specified limit. The blocking performance shall apply at all frequencies except those at which a spurious response occur.

# 7.6.1 Minimum requirement (In-band blocking)

The BER shall not exceed 0.001 for the parameters specified in Table 7.6. In-band blocking is defined for an unwanted interfering signal falling into the UE receive band or into the first 15 MHz below or above the UE receive band.

#### Table 7.6K: In-band blocking requirements, dual band 4C-HSDPA, dual uplink operation

## 7.6.2 Minimum requirement (Out-of-band blocking)

The BER shall not exceed 0.001 for the parameters specified in Table 7.7. Out-of-band blocking is defined for an unwanted interfering signal falling more than 15 MHz below or above the UE receive band.

For Table 7.7 in frequency range 1, 2 and 3, up to 24 exceptions are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable.

For Table 7.7 in frequency range 4, up to 8 exceptions are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable

### Table 7.7: Out of band blocking

Band IV	For 2095≤f≤2170 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause
operation	7.5.1 and subclause 7.6.1 shall be applied.
Band V	For 854≤f≤909 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause
operation	7.5.1 and subclause 7.6.1 shall be applied.
Band VI	For 860≤f≤900 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause
operation	7.5.1 and subclause 7.6.1 shall be applied.
Band VII	For $2605 \le f \le 2705$ MHz, the appropriate in-band blocking or adjacent channel selectivity in
operation	subclause 7.5.1 and subclause 7.6.1 shall be applied.
Band VIII	For $910 \le f \le 975$ MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause
operation	7.5.1 and subclause 7.6.1 shall be applied.
Band IX	For 1829.9≤f≤ 1894.9 MHz, the appropriate in-band blocking or adjacent channel selectivity in
operation	subclause 7.5.1 and subclause 7.6.1 shall be applied.
Band X	For 2095≤f ≤2185 MHz, the appropriate in-band blocking or adjacent channel selectivity in
operation	subclause 7.5.1 and subclause 7.6.1 shall be applied.
Band XI	For 1460.9≤f≤ 1510.9 MHz, the appropriate in-band blocking or adjacent channel selectivity in
operation	subclause 7.5.1 and subclause 7.6.1 shall be applied.
Band XII	For $714 \le f \le 761$ MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause
operation	7.5.1 and subclause 7.6.1 shall be applied.
Band XIII	For $731 \le f \le 771$ MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause
operation	7.5.1 and subclause 7.6.1 shall be applied.
Band XIV	For $743 \le f \le 783$ MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause
operation	7.5.1 and subclause 7.6.1 shall be applied.
Band XIX	For 860≤f≤905 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause
operation	7.5.1 and subclause 7.6.1 shall be applied.
Band XX	For 776≤f≤836 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause
operation	7.5.1 and subclause 7.6.1 shall be applied.
Band XXI	For 1480.9≤f ≤1525.9 MHz, the appropriate in-band blocking or adjacent channel selectivity in
operation	subclause 7.5.1 and subclause 7.6.1 shall be applied.
NOTE	For the UE which supports both Band XI and Band XXI operating frequencies, the Out of band blocking is FFS.

## NOTE: $\langle \text{REFSENS} \rangle$ and $\langle \text{REF}\hat{l}_{or} \rangle$ refer to the DPCH_Ec $\langle \text{REFSENS} \rangle$ and the DPCH $\langle \text{REF}\hat{l}_{or} \rangle$ as specified in Table 7.2.

## 7.6.2A Additional requirement for DC-HSDPA (Out-of-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.7AA. Out-ofband band blocking is defined for an unwanted interfering signal falling more than 15 MHz below or above the UE receive band.

For Table 7.7AA in frequency range 1, 2 and 3, up to 24 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable.

For Table 7.7AA in frequency range 4, up to 8 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable.

Table 7.7AA: Out of band blocking for DC-HSDPA

Band IV	For 2095≤f≤2170 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause
operation	7.5.2 and subclause 7.6.1A shall be applied.
Band V	For 854≤f≤909 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause
operation	7.5.2 and subclause 7.6.1A shall be applied.
Band VI	For 860≤f≤900 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause
operation	7.5.2 and subclause 7.6.1A shall be applied.
Band VII	For $2605 \le f \le 2705$ MHz, the appropriate in-band blocking or adjacent channel selectivity in
operation	subclause 7.5.2 and subclause 7.6.1A shall be applied.
Band VIII	For 910 $\leq$ f $\leq$ 975 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause
operation	7.5.2 and subclause 7.6.1A shall be applied.
Band IX	For 1829.9≤f≤ 1894.9 MHz, the appropriate in-band blocking or adjacent channel selectivity in
operation	subclause 7.5.2 and subclause 7.6.1A shall be applied.
Band X	For 2095≤f ≤2185 MHz, the appropriate in-band blocking or adjacent channel selectivity in
operation	subclause 7.5.2 and subclause 7.6.1A shall be applied.
Band XI	For 1460.9≤f≤ 1510.9 MHz, the appropriate in-band blocking or adjacent channel selectivity in
operation	subclause 7.5.2 and subclause 7.6.1A shall be applied.
Band XII	For 714 $\leq$ f $\leq$ 761 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause
operation	7.5.2 and subclause 7.6.1A shall be applied.
Band XIII	For 731 $\leq$ f $\leq$ 771 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause
operation	7.5.2 and subclause 7.6.1A shall be applied.
Band XIV	For $743 \le f \le 783$ MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause
operation	7.5.2 and subclause 7.6.1A shall be applied.
Band XIX	For 860≤f≤905 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause
operation	7.5.2 and subclause 7.6.1A shall be applied.
Band XX	For 776≤f≤836 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause
operation	7.5.2 and subclause 7.6.1A shall be applied.
Band XXI	For 1480.9≤f ≤1525.9 MHz, the appropriate in-band blocking or adjacent channel selectivity in
operation	subclause 7.5.2 and subclause 7.6.1A shall be applied.
NOTE	For the UE which supports both Band XI and Band XXI operating frequencies, the Out of band blocking is FFS.

## NOTE: $\langle \text{REFSENS} \rangle$ and $\langle \text{REF}\hat{I}_{or} \rangle$ refer to the HS-PDSCH_Ec $\langle \text{REFSENS} \rangle$ and the HS-PDSCH $\langle \text{REF}\hat{I}_{or} \rangle$ as specified in Table 7.2A.

## 7.6.2B Additional requirement for DB-DC-HSDPA (Out-of-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.7AB. Out-ofband blocking is defined for an unwanted interfering signal falling at frequencies outside of frequency regions defined as the UE receive bands extended by 15 MHz at their lower and upper ends. For Table 7.7AB in frequency range 1, 2 and 3, up to 24 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable.

For Table 7.7AB in frequency range 4, up to 8 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable.

# 7.6.2C Additional requirement for single band 4C-HSDPA (Out-of-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.7AC and Table 7.7AD. Out-of-band band blocking is defined for an unwanted interfering signal falling more than 15 MHz below or above the UE receive band. The requirement is not applicable for dual uplink operation.

For Table 7.7AC in frequency range 1, 2 and 3, up to 24 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable.

For Table 7.7AC in frequency range 4, up to 8 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable.

# 7.6.2D Additional requirement for dual band 4C-HSDPA (Out-of-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.7AE and Table 7.7AF. Out-of-band blocking is defined for an unwanted interfering signal falling at frequencies outside of frequency regions defined as the UE receive bands extended by 15 MHz at their lower and upper ends. The requirement is not applicable for dual uplink operation.

For Table 7.7AF in frequency range 1, 2 and 3, up to 24 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable.

For Table 7.7AF in frequency range 4, up to 8 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable.

NOTE:  $\langle \text{REFSENS} \rangle$  and  $\langle \text{REF}\hat{I}_{or} \rangle$  refer to the HS-PDSCH_Ec $\langle \text{REFSENS} \rangle$  and the HS-PDSCH $\langle \text{REF}\hat{I}_{or} \rangle$  as specified in Table 7.2D.

#### 7.6.3 Minimum requirement (Narrow band blocking)

The BER shall not exceed 0.001 for the parameters specified in Table 7.7A. This requirement is measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an unwanted narrow band interferer at a frequency, which is less than the nominal channel spacing.

Parameter	Unit	Band II, IV, V, X	Band III, VIII, XII, XIII, XIV	
DPCH_Ec	dBm/3.84 MHz	<refsens> + 10 dB</refsens>	<refsens> + 10 dB</refsens>	
Î _{or}	dBm/3.84 MHz	<refî<sub>or&gt; + 10 dB</refî<sub>	<refî<sub>or&gt; + 10 dB</refî<sub>	
Iblocking (GMSK)	dBm	-57	-56	
Fuw (offset)	MHz	2.7	2.8	
UE transmitted mean	dBm	20 (for Power class 3 and 3bis)		
power	ubiii	18 (for Pow	er class 4)	

- NOTE 1: I_{blocking} (GMSK) is an interfering signal as defined in TS 45.004 [6]
- NOTE 2: <REFSENS> and <REF $\hat{I}_{or}$ > refer to the DPCH_Ec<REFSENS> and the DPCH<REF $\hat{I}_{or}$ > as specified in Table 7.2.

# 7.6.3A Additional requirement for DC-HSDPA and DB-DC-HSDPA (Narrow band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.7B. This requirement is measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an unwanted narrow band interferer at a frequency, which is less than the nominal channel spacing.

Parameter	Unit	Band II, IV, V, X	Band III, VIII, XII, XIII, XIV
HS-PDSCH_Ec	dBm/3.84 MHz	<refsens> + 10 dB</refsens>	<refsens> + 10 dB</refsens>
Î _{or}	dBm/3.84 MHz	<refî<sub>or&gt; + 10 dB</refî<sub>	<refî<sub>or&gt; + 10 dB</refî<sub>
Iblocking (GMSK)	dBm	-57	-56
F _{uw} (offset) (NOTE 2)	MHz	±2.7	±2.8
UE transmitted mean power	dBm	20 (for Power cla 18 (for Power	

Table 7.7B: Narrow band blocking characteristics for DC-HSDPA

- NOTE 1:  $I_{blocking}$  (GMSK) is an interfering signal as defined in TS 45.004 [6]
- NOTE 2: For DC-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency used and positive offset refers to the assigned channel frequency of the highest carrier frequency used. For DB-DC-HSDPA, offset refers to the assigned channel frequencies of the individual cells.
- NOTE 3:  $\langle \text{REFSENS} \rangle$  and  $\langle \text{REFI}_{or} \rangle$  refer to the HS-PDSCH_Ec $\langle \text{REFSENS} \rangle$  and the HS-PDSCH $\langle \text{REFI}_{or} \rangle$  as specified in Table 7.2A for DC-HSDPA and Table 7.2B for DB-DC-HSDPA.

### 7.6.3B Additional requirement for DC-HSUPA (Narrow band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.7C and Table 7.7D. This requirement is measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an unwanted narrow band interferer at a frequency, which is less than the nominal channel spacing.

Parameter	Unit	Band II, IV, V, X	Band III, VIII, XII, XIII, XIV
Iblocking (GMSK)	dBm	-57	-56
F _{uw} (offset) (NOTE 2)	MHz	±2.7	±2.8
UE transmitted mean power	dBm	20 (for Power class 3 and 3bis) 18 (for Power class 4)	

Table 7.7C: Narrow band blocking characteristics for DC-HSUPA

- NOTE 1: I_{blocking} (GMSK) is an interfering signal as defined in TS 45.004 [6]
- NOTE 2: For DC-HSUPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency used and positive offset refers to the assigned channel frequency of the highest carrier frequency used.

Table 7.7D: Reference input powers for narrow-band blocking, DC-HSUPA.

Operati	ng Band	Unit	HS-PDSCH_Ec	Î _{or}

1-2-V-2	V	V	-99.8	-89.5	20 (for Power class 3 and 3bis) 18 (for Power class 4)	Minimum

## 7.7 Spurious response

#### 7.7.1 Minimum requirement

Spurious response is a measure of the receiver's ability to receive a wanted signal on its assigned channel frequency without exceeding a given degradation due to the presence of an unwanted CW interfering signal at any other frequency at which a response is obtained i.e. for which the out of band blocking limit as specified in subclause 7.6.2 is not met.

The BER shall not exceed 0.001 for the parameters specified in Table 7.8.

Table 7.8: Spurious Response

Parameter	Unit	Level
DPCH_Ec	dBm/3.84 MHz	<refsens> +3 dB</refsens>
Î _{or}	dBm/3.84 MHz	<refî<sub>or&gt; +3 dB</refî<sub>
I _{blocking} (CW)	dBm	-44
F _{uw}	MHz	Spurious response frequencies
UE transmitted mean power	dBm	20 (for Power class 3 and 3bis) 18 (for Power class 4)

NOTE:  $\langle \text{REFSENS} \rangle$  and  $\langle \text{REF}\hat{I}_{or} \rangle$  refer to the DPCH_Ec $\langle \text{REFSENS} \rangle$  and the DPCH $\langle \text{REF}\hat{I}_{or} \rangle$  as specified in Table 7.2.

# 7.7.2 Additional requirement for DC-HSDPA, DB-DC-HSDPA and single band/dual band 4C-HSDPA

Spurious response is a measure of the receiver's ability to receive a wanted signal on its assigned channel frequency without exceeding a given degradation due to the presence of an unwanted CW interfering signal at any other frequency at which a response is obtained i.e. for which the out of band blocking limit as specified in subclause 7.6.2A, 7.6.2B, 7.6.2C or 7.6.2D is not met.

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.8A. The requirement is not applicable for dual uplink operation.

Parameter	Unit	Level
HS-PDSCH_Ec	dBm/3.84 MHz	<refsens> +3 dB</refsens>
Î _{or}	dBm/3.84 MHz	<refî<sub>or&gt; +3 dB</refî<sub>
Iblocking (CW)	dBm	-44
F _{uw}	MHz	Spurious response frequencies
UE transmitted mean	dBm	20 (for Power class 3 and 3bis)
power	dBill	18 (for Power class 4)

NOTE:  $\langle \text{REFSENS} \rangle$  and  $\langle \text{REF}\hat{l}_{or} \rangle$  refer to the HS-PDSCH_Ec $\langle \text{REFSENS} \rangle$  and the HS-PDSCH $\langle \text{REF}\hat{l}_{or} \rangle$  as specified in Table 7.2A for DC-HSDPA, Table 7.2B for DB-DC-HSDPA, Table 7.2C for single band 4C-HSDPA and Table 7.2D for dual band 4C-HSDPA.

## 7.8 Intermodulation characteristics

Third and higher order mixing of the two interfering RF signals can produce an interfering signal in the band of the desired channel. Intermodulation response rejection is a measure of the capability of the receiver to receiver a wanted signal on its assigned channel frequency in the presence of two or more interfering signals which have a specific frequency relationship to the wanted signal.

### 7.8.1 Minimum requirement

The BER shall not exceed 0.001 for the parameters specified in Table 7.9.

Parameter	Unit	Level	
DPCH_Ec	dBm/3.84 MHz	<refsens> +3 dB</refsens>	
Î _{or}	dBm/3.84 MHz	<refî<sub>o</refî<sub>	r> +3 dB
I _{ouw1} (CW)	dBm	-46	
l _{ouw2} mean power (modulated)	dBm	-46	
F _{uw1} (offset)	MHz	10	-10
F _{uw2} (offset)	MHz	20	-20
UE transmitted mean power	dBm	20 (for Power class 3 and 3bis) 18 (for Power class 4)	

Table 7.9: Receive intermodulation characteristics

- NOTE 1: I_{ouw2} (modulated) consists of the common channels needed for tests as specified in Table C.7 and 16 dedicated data channels as specified in Table C.6.
- NOTE 2: <REFSENS> and <REF $\hat{l}_{or}$ > refer to the DPCH_Ec<REFSENS> and the DPCH<REF $\hat{l}_{or}$ > as specified in Table 7.2.

## 7.8.1A Additional requirement for DC-HSDPA and DB-DC-HSDPA

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.9AA.

Parameter	Unit	Level	
HS-PDSCH_Ec	dBm/3.84 MHz	<refsens> +3 dB</refsens>	
Î _{or}	dBm/3.84 MHz	<refîo< td=""><td>r&gt; +3 dB</td></refîo<>	r> +3 dB
I _{ouw1} (CW)	dBm	-4	46
l _{ouw2} mean power (modulated)	dBm	-46	
F _{uw1} (offset) (NOTE 2)	MHz	10	-10
F _{uw2} (offset) (NOTE 2)	MHz	20	-20
UE transmitted mean power	dBm	20 (for Power class 3 and 3bis) 18 (for Power class 4)	

Table 7.9AA: Receive intermodulation characteristics

- NOTE 1: I_{ouw2} (modulated) consists of the common channels needed for tests as specified in Table C.7 and 16 dedicated data channels as specified in Table C.6.
- NOTE 2: For DC-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency used and positive offset refers to the assigned channel frequency of the highest carrier frequency used. For DB-DC-HSDPA, offset refers to the assigned channel frequencies of the individual cells.
- NOTE 3: <REFSENS> and <REF $\hat{I}_{or}$ > refers to the HS-PDSCH_Ec<REFSENS> and the HS-PDSCH<REF $\hat{I}_{or}$ > as specified in Table 7.2A.

## 7.8.1B Additional requirement for DC-HSUPA

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.9AB and Table 7.9AC.

Parameter	Unit	Lev	/el
I _{ouw1} (CW)	dBm	-46	
l _{ouw2} mean power (modulated)	dBm	-4	6
F _{uw1} (offset) (NOTE 2)	MHz	10	-10
F _{uw2} (offset) (NOTE 2)	MHz	20	-20
UE transmitted mean power	dBm	20 (for Power class 3 and 3bis) 18 (for Power class 4)	

Table 7.9AB: Receive intermodulation characteristics

- NOTE 1:  $I_{ouw2}$  (modulated) consists of the common channels needed for tests as specified in Table C.7 and 16 dedicated data channels as specified in Table C.6.
- NOTE 2: For DC-HSUPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency used and positive offset refers to the assigned channel frequency of the highest carrier frequency used.

Table 7.9AC: Reference input powers for	r intermod, DC-HSUPA.

## 7.8.1C Additional requirement for single band 4C-HSDPA

#### 7.8.1C.1 Single uplink operation

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.9AD and Table 7.9AE.

## Table 7.9AD: Test parameters for receive intermodulation characteristics, single band 4C-HSDPA, single uplink operation

Parameter	Unit	Le	vel	
I _{ouw1} (CW)	dBm	-46		
l _{ouw2} mean power (modulated)	dBm	-4	16	
F _{uw1} (offset) (NOTE 2)	MHz	10	-10	
F _{uw2} (offset) (NOTE 2)	MHz	20	-20	
UE transmitted mean power	dBm	20 (for Power c 18 (for Pov	lass 3 and 3bis) ver class 4)	

- NOTE 1: I_{ouw2} (modulated) consists of the common channels needed for tests as specified in Table C.7 and 16 dedicated data channels as specified in Table C.6.
- NOTE 2: For single band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequencies, and positive offset refers to the assigned channel frequency of the highest carrier frequencies.

#### Table 7.9AE: Intermodulation requirements, single band 4C-HSDPA, single uplink operation

Single band 4C-HSDPA Configuration	C-HSDPA Band (dBm/3.84MHz)		Î _{or} (dBm/3.84MHz)	UL-DL carrier separation
I-3		<refsens>+3 dB</refsens>	<refî<sub>or&gt;+3 dB</refî<sub>	Minimum

NOTE:  $\langle \text{REFSENS} \rangle$  and  $\langle \text{REFI}_{or} \rangle$  refer to the HS-PDSCH_Ec $\langle \text{REFSENS} \rangle$  and the HS-PDSCH $\langle \text{REFI}_{or} \rangle$  as specified in Table 7.2C for single band 4C-HSDPA.

#### 7.8.1C.2 Dual uplink operation

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.9AF and Table 7.9AG.

## Table 7.9AF: Receive intermodulation characteristics for single band 4C-HSDPA, dual uplink operation

Parameter	Unit	Lev	vel	
I _{ouw1} (CW)	dBm	-4	6	
l _{ouw2} mean power (modulated)	dBm	-46		
F _{uw1} (offset) (NOTE 2)	MHz	10	-10	
F _{uw2} (offset) (NOTE 2)	MHz	20	-20	

- NOTE 1: I_{ouw2} (modulated) consists of the common channels needed for tests as specified in Table C.7 and 16 dedicated data channels as specified in Table C.6.
- NOTE 2: For single band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequencies, and positive offset refers to the assigned channel frequency of the highest carrier frequencies.

Single band 4C-HSDPA Configuration	DL Band	HS-PDSCH_Ec (dBm/3.84MHz)	Î _{or} (dBm/3.84MHz)	UE transmitted mean power (dBm)	UL-DL carrier separation				
I-3	I	-105	-94.7	20 (for Power class 3 and 3bis) 18 (for Power class 4)	Minimum				
NOTE 1       For the UE which supports DB-DC-HSDPA configuration in Table 5.0aA the < HS-PDSCH_Ec > and < Î _{or} > are allowed to be increased by an amount defined in Table 7.12.         NOTE 2       For the UE which supports dual band 4C-HSDPA configuration in Table 5.0aC the < HS-PDSCH_Ec > and < Î _{or} > are allowed to be increased by an amount defined in Table 7.13.									

Table 7.9AG: Intermodulation requirements, single band 4C-HSDPA, dual uplink operation

## 7.8.1D Additional requirement for dual band 4C-HSDPA

#### 7.8.1D.1 Single uplink operation

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.9AH and Table 7.9AI.

Table 7.9AH: Test parameters for receive intermodulation characteristics, dual band 4C-HSDPA,
single uplink operation

Parameter	Unit	Level		
I _{ouw1} (CW)	dBm	3m -46		
I _{ouw2} mean power (modulated)	dBm	-46		
F _{uw1} (offset) (NOTE 2)	MHz	10	-10	
F _{uw2} (offset) (NOTE 2)	MHz	20	-20	
UE transmitted mean power	dBm		lass 3 and 3bis) ver class 4)	

- NOTE 1: I_{ouw2} (modulated) consists of the common channels needed for tests as specified in Table C.7 and 16 dedicated data channels as specified in Table C.6.
- NOTE 2: For dual band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequenc(ies) in each band, and positive offset refers to the assigned channel frequency of the highest carrier frequenc(ies) in each band.

Table 7.9AI: Intermodulation requirements, dual band 4C-HSDPA, single uplink operation

Dual band 4C-HSDPA Configuration	DL Band	UL Band	HS-PDSCH_Ec (dBm/3.84MHz)	Î _{or} (dBm/3.84MHz)	UL-DL carrier separation
		1	<refsens>+3 dB</refsens>	<refî<sub>or&gt;+3 dB</refî<sub>	Minimum
I-2-VIII-1	VIII	I	<refsens>+3 dB</refsens>	<refî<sub>or&gt;+3 dB</refî<sub>	Minimum
I-3-VIII-1	-	VIII	<refsens>+3 dB</refsens>	<refî<sub>or&gt;+3 dB</refî<sub>	Minimum

			18	(for Power class 4)	)	

## 7.8.2 Minimum requirement (Narrow band)

The BER shall not exceed 0.001 for the parameters specified in Table 7.9A.

#### Table 7.9A: Receive intermodulation characteristics

Parameter	Unit	Band II,	Band II, IV, V, X		Band III, VIII, XII, XIII, XIV	
DPCH_Ec	dBm/3.84 MHz	<refsens< td=""><td>S&gt;+ 10 dB</td><td><refsen< td=""><td>IS&gt;+ 10 dB</td></refsen<></td></refsens<>	S>+ 10 dB	<refsen< td=""><td>IS&gt;+ 10 dB</td></refsen<>	IS>+ 10 dB	
Î _{or}	dBm/3.84 MHz	<refî<sub>or&gt; + 10 dB</refî<sub>		<refî<sub>or&gt; +10 dB</refî<sub>		
I _{ouw1} (CW)	dBm	-4	-44		43	
I _{ouw2} (GMSK)	dBm	-4	-44		43	
F _{uw1} (offset)	MHz	3.5	-3.5	3.6	-3.6	
F _{uw2} (offset)	MHz	5.9	-5.9	6.0	-6.0	
UE transmitted mean power	dBm	20 (for Power class 3 and 3bis) 18 (for Power class 4)		bis)		

NOTE 1: I_{ouw2} (GMSK) is an interfering signal as defined in TS 45.004 [6].

NOTE 2: <REFSENS> and <REF $\hat{l}_{or}$ > refer to the DPCH_Ec<REFSENS> and the DPCH<REF $\hat{l}_{or}$ > as specified in Table 7.2.

# 7.8.2A Additional requirement for DC-HSDPA and DB-DC-HSDPA (Narrow band)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.9B.

Parameter	Unit	Band II, IV, V, X		Band III, VIII, XII, XIII, XIV	
HS-PDSCH_Ec	dBm/3.84 MHz <refsens>+ 10 dB</refsens>		<refsens>+ 10 dB</refsens>		
Î _{or}			<refî<sub>or</refî<sub>	<refî<sub>or&gt; +10 dB</refî<sub>	
I _{ouw1} (CW)	dBm	dBm -44		-43	
I _{ouw2} (GMSK)	dBm	-44		-43	
F _{uw1} (offset) (NOTE 2)	MHz	3.5	-3.5	3.6	-3.6
F _{uw2} (offset) (NOTE 2)	MHz	5.9	-5.9	6.0	-6.0
UE transmitted mean power	dBm	20 (for Power class 3 and 3bis) 18 (for Power class 4)			bis)

Table 7.9B: Receive intermodulation characteristics

NOTE 1: I_{ouw2} (GMSK) is an interfering signal as defined in TS 45.004 [6].

- NOTE 2: For DC-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency used and positive offset refers to the assigned channel frequency of the highest carrier frequency used. For DB-DC-HSDPA, offset refers to the assigned channel frequencies of the individual cells.
- NOTE3:  $\langle \text{REFSENS} \rangle$  and  $\langle \text{REFI}_{or} \rangle$  refers to the HS-PDSCH_Ec $\langle \text{REFSENS} \rangle$  and the HS-PDSCH $\langle \text{REFI}_{or} \rangle$  as specified in Table 7.2A for DC-HSDPA and Table 7.2B for DB-DC-HSDPA.

## 7.8.2B Additional requirement for DC-HSUPA (Narrow band)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.9C and Table 7.9D.

Parameter	Unit	Band II, IV, V, X		Band III, VIII, XII, XIII, XIV	
I _{ouw1} (CW)	dBm	-44		-43	
I _{ouw2} (GMSK)	dBm	-44		-43	
F _{uw1} (offset) (NOTE 2)	MHz	3.5	-3.5	3.6	-3.6
F _{uw2} (offset) (NOTE 2)	MHz	5.9	-5.9	6.0	-6.0
UE transmitted mean power	dBm	20 (for Power class 3 and 3bis) 18 (for Power class 4)			

Table 7.9C: Receive intermodulation characteristics

NOTE 1:  $I_{ouw2}$  (GMSK) is an interfering signal as defined in TS 45.004 [6].

NOTE 2: For DC-HSUPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency used and positive offset refers to the assigned channel frequency of the highest carrier frequency used.

Table 7.9D: Reference input powers for intermodulation, narrow-band, DC-HSUPA.

Operating Band	Unit	HS-PDSCH_Ec	Î _{or}			
II	dBm/3.84 MHz	-86.7	-76.4			
	dBm/3.84 MHz	-85.7	-75.4			
IV	dBm/3.84 MHz	-86.7	-76.4			
V	dBm/3.84 MHz	-86.7	-76.4			
VIII	dBm/3.84 MHz	-85.6	-75.3			
Х	dBm/3.84 MHz	-86.7	-76.4			
XII	dBm/3.84 MHz	N/A	N/A			
XIII	dBm/3.84 MHz	N/A	N/A			
XIV	dBm/3.84 MHz	N/A	N/A			
NOTE 1 For the U	E which supports DB-DO	C-HSDPA configuration in Table	5.0aA the < HS-PDSCH_Ec >			
	and $<\hat{l}_{or}$ > are allowed to be increased by an amount defined in Table 7.12.					
		and 4C-HSDPA configuration in				
PDSCH_E	Ec > and < Î _{or} > are allo [,]	wed to be increased by an amou	Int defined in Table 7.13.			

## 7.8.2C Additional requirement for single band 4C-HSDPA (Narrow band)

## 7.8.2D Additional requirement for dual band 4C-HSDPA (Narrow band)

#### 7.8.2D.1 Single uplink operation

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.9E and Table 7.9F.

Table 7.9E: Test parameters for receive narrow-band intermodulation characteristics, dual band 4C-
HSDPA, single uplink operation

Parameter	Unit	Band II, IV, V		Band VIII	
I _{ouw1} (CW)	dBm	-44		-43	
I _{ouw2} (GMSK)	dBm	-44		-43	
F _{uw1} (offset) (NOTE 2)	MHz	3.5	-3.5	3.6	-3.6
F _{uw2} (offset) (NOTE 2)	MHz	5.9	-5.9	6.0	-6.0
UE transmitted mean power	dBm	20 (for Power class 3 and 3bis) 18 (for Power class 4)			

NOTE 1: I_{ouw2} (GMSK) is an interfering signal as defined in TS 45.004 [6].

NOTE 2: For dual band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequenc(ies) in each band, and positive offset refers to the assigned channel frequency of the highest carrier frequenc(ies) in each band.

Table 7.9F: Narrow-band intermodulation requirements, dual band 4C-HSDPA, single uplink
operation

Dual band 4C-HSDPA Configuration	DL Band	UL Band	HS-PDSCH_Ec (dBm/3.84MHz)	Î _{or} (dBm/3.84MHz)	UL-DL carrier separation
I-2-VIII-1 I-3-VIII-1	VIII	I	<refsens>+16.6 dB</refsens>	$<$ REF $\hat{I}_{or}$ >+16.6 dB	Minimum
	VIII	VIII	<refsens>+16.6 dB</refsens>	<refî<sub>or&gt;+16.6 dB</refî<sub>	Minimum
		П	<refsens>+17 dB</refsens>	<refî<sub>or&gt;+17 dB</refî<sub>	Minimum
II-1-IV-2	IV		<refsens>+18.9 dB</refsens>	<refî<sub>or&gt;+18.9 dB</refî<sub>	Minimum

11-2-10-2	IV	IV	<refsens>+18.9 dB</refsens>	<refî<sub>or&gt;+18.9 dB</refî<sub>	Minimum
I-1-V-2	V	I	<refsens>+17 dB</refsens>	<refî<sub>or&gt;+17 dB</refî<sub>	Minimum
I-2-V-1 I-2-V-2	V	V	<refsens>+17 dB</refsens>	<refî<sub>or&gt;+17 dB</refî<sub>	Minimum

NOTE:  $\langle REFSENS \rangle$  and  $\langle REF\hat{l}_{or} \rangle$  refers to the HS-PDSCH_Ec $\langle REFSENS \rangle$  and the HS-PDSCH $\langle REF\hat{l}_{or} \rangle$  as specified in Table 7.2D for dual band 4C-HSDPA.

#### 7.8.2D.2 Dual uplink operation

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.9G and Table 7.9H.

## Table 7.9G: Test parameters for receive narrow-band intermodulation characteristics, dual band 4C-HSDPA, dual uplink operation

Parameter	Unit	Band II	, IV, V	Band VIII		
I _{ouw1} (CW)	dBm	-44		-43		
Iouw2 (GMSK)	dBm	-44		-43		
F _{uw1} (offset) (NOTE 2)	MHz	3.5	-3.5	3.6	-3.6	
F _{uw2} (offset) (NOTE 2)	MHz	5.9	-5.9	6.0	-6.0	

NOTE 1: I_{ouw2} (GMSK) is an interfering signal as defined in TS 45.004 [6].

NOTE 2: For dual band 4C-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequenc(ies) in each band, and positive offset refers to the assigned channel frequency of the highest carrier frequenc(ies) in each band.

## 7.9 Spurious emissions

The spurious emissions power is the power of emissions generated or amplified in a receiver that appear at the UE antenna connector. The spurious emission is verified per antenna connector with the other(s) terminated.

### 7.9.1 Minimum requirement

The power of any narrow band CW spurious emission shall not exceed the maximum level specified in Table 7.10 and Table 7.11

		-	••••••••••	
Frequency Band	Measurement	Maximum	Note	

#### Table 7.10: General receiver spurious emission requirements

Note * The measurements are made on frequencies which are integer multiples of 200 kHz. As exceptions, up to five measurements with a level up to the applicable requirements defined in Table 7.10 are permitted for each UARFCN used in the measurement

## 7.10 Reference input power adjustment for a dual band device

For the UE which supports DB-DC-HSDPA configuration in Table 5.0aA, the reference input powers (HS-PDSCH_Ec and  $\hat{l}_{or}$ ) of core requirements specified in subclause 7.6.1B, 7.6.1C.2, 7.6.3B, 7.8.1B, 7.8.1C.2, and 7.8.2B are allowed to be increased by the amount given in Table 7.12 for the applicable bands.

Table 7.12: Allowed increase	or for or which suppor	

DB-DC-HSDPA Configuration	Allowed increase of HS-PDSCH Ec and $\hat{I}_{or}$ (dB)	Applicable bands
1	0.5	I, VIII
2	1	II, IV
3	0.5	I, V

For the UE which supports dual band 4C-HSDPA configuration in Table 5.0aC, the reference input powers (HS-PDSCH_Ec and  $\hat{l}_{or}$ ) of core requirements specified in subclause 7.6.1B, 7.6.1C.2, 7.6.3B, 7.8.1B, 7.8.1C.2, and 7.8.2B are allowed to be increased by the amount given in Table 7.13 for the applicable bands.

Table 7.13: Allowed increase of HS-PDSCH Ec and  $\hat{I}_{or}$  for UE which supports dual band 4C-HSDPA.

Dual Band 4C-HSDPA Configuration	Allowed increase of HS-PDSCH Ec and $\hat{I}_{or}$ (dB)	Applicable bands
I-2-VIII-1 I-3-VIII-1	0.5	I, VIII
II-1-IV-2 II-2-IV-1 II-2-IV-2	1	II, IV
I-1-V-2 I-2-V-1 I-2-V-2	0.5	I, V

## 8 Performance requirement

## 8.1 General

The performance requirements for the UE in this subclause are specified for the measurement channels specified in Annex A, the propagation conditions specified in Annex B and the Down link Physical channels specified in Annex C. Unless stated DL power control is OFF. Unless otherwise stated the performance requirements are specified at the antenna connector of the UE. For UE(s) with an integral antenna only, a reference antenna with a gain of 0 dBi is assumed. UE with an integral antenna may be taken into account by converting these power levels into field strength requirements, assuming a 0 dBi gain antenna. For UE(s) with more than one receiver antenna connector the fading of the signals and the AWGN signals applied to each receiver antenna connector shall be uncorrelated. The levels of the test signal applied to each of the antenna connectors shall be as defined in the respective sections below.

For a UE which supports optional enhanced performance requirements type1 for DCH and an alternative requirement is specified, the UE shall meet only the enhanced performance requirement type1. For those cases where the enhanced performance requirements type1 are not specified, the minimum performance requirements shall apply.

## 8.2 Demodulation in static propagation conditions

- 8.2.1 (void)
- 8.2.2 (void)

## 8.2.3 Demodulation of Dedicated Channel (DCH)

The receive characteristic of the Dedicated Channel (DCH) in the static environment is determined by the Block Error Ratio (BLER). BLER is specified for each individual data rate of the DCH. DCH is mapped into the Dedicated Physical Channel (DPCH).

#### 8.2.3.1 Minimum requirement

For the parameters specified in Table 8.5 the average downlink  $\underline{DPCH}_{E_c}$  power ratio shall be below the specified

value for the BLER shown in Table 8.6. These requirements are applicable for TFCS size 16.

Parameter	Unit	Test 1	Test 2	Test 3	Test 4
Phase reference		P-CPICH			
$\hat{I}_{or}/I_{oc}$	dB	-1			
I _{oc}	dBm/3.84 MHz	-60			
Information Data Rate	kbps	12.2	64	144	384

#### Table 8.5: DCH parameters in static propagation conditions

Ior

Table 8.6: DCH requirements in static	propagation conditions
---------------------------------------	------------------------

Test Number	$\frac{DPCH_E_c}{I_{or}}$	BLER
1	-16.6 dB	10 ⁻²
2	-13.1 dB	10 ⁻¹
	-12.8 dB	10 ⁻²
2	-9.9 dB	10 ⁻¹
3	-9.8 dB	10 ⁻²
	-5.6 dB	10 ⁻¹
4	-5.5 dB	10 ⁻²

# 8.3 Demodulation of DCH in multi-path fading propagation conditions

### 8.3.1 Single Link Performance

The receive characteristics of the Dedicated Channel (DCH) in different multi-path fading environments are determined by the Block Error Ratio (BLER) values. BLER is measured for the each of the individual data rate specified for the DPCH. DCH is mapped into in Dedicated Physical Channel (DPCH).

#### 8.3.1.1 Minimum requirement

For the parameters specified in Table 8.7, 8.9, 8.11, 8.13 and 8.14A the average downlink  $\frac{DPCH_{-E_{c}}}{I_{or}}$  power ratio shall be below the specified value for the BLER shown in Table 8.8, 8.10, 8.12, 8.14 and 8.14B. If the UE supports optional

enhanced performance requirements type1 for DCH then for the parameters specified in Table 8.10A the average downlink  $\underline{DPCH_{E_c}}_{I_{or}}$  power ratio shall be below the specified value for the BLER shown in 8.10B, and Test 5, Test 6

and Test 8 shall be replaced by Test 5a, Test 6a and Test 8a. These requirements are applicable for TFCS size 16.

Table 8.7: Test Parameters for DCH in multi-path fading propagation conditions (Case 1)

## 8.4 Demodulation of DCH in moving propagation conditions

### 8.4.1 Single link performance

The receive single link performance of the Dedicated Channel (DCH) in dynamic moving propagation conditions are determined by the Block Error Ratio (BLER) values. BLER is measured for the each of the individual data rate specified for the DPCH. DCH is mapped into Dedicated Physical Channel (DPCH).

#### 8.4.1.1 Minimum requirement

For the parameters specified in Table 8.15 the average downlink  $\underline{DPCH_{-}E_{c}}_{I_{or}}$  power ratio shall be below the specified

value for the BLER shown in Table 8.16.

Table 8.15: DCH	parameters in	moving p	propagation	conditions

2	-10.9 dB	10 ⁻²

 Table 8.16: DCH requirements in moving propagation conditions

## 8.5 Demodulation of DCH in birth-death propagation conditions

#### 8.5.1 Single link performance

The receive single link performance of the Dedicated Channel (DCH) in dynamic birth-death propagation conditions are determined by the Block Error Ratio (BLER) values. BER is measured for the each of the individual data rate specified for the DPCH. DCH is mapped into Dedicated Physical Channel (DPCH).

#### 8.5.1.1 Minimum requirement

For the parameters specified in Table 8.17 the average downlink  $\underline{DPCH_{-}E_{c}}$  power ratio shall be below the specified  $I_{or}$ 

value for the BLER shown in Table 8.18.

#### Table 8.17: DCH parameters in birth-death propagation conditions

1	-12.6 dB	10 ⁻²
2	-8.7 dB	10 ⁻²

## 8.5A Demodulation of DCH in high speed train condition

#### 8.5A.1 General

The receiver performance of the DCH in high speed train condition is determined by the BLER values. BLER is measured for the individual data rate specified for the DPCH. DCH is mapped into DPCH.

#### 8.5A.2 Minimum requirement

For the parameters specified in Table 8.18A the average downlink DPCH _ E_ power ratio shall be below the specified

 $I_{or}$ 

value for the BLER shown in Table 8.18B.

Parameter	Unit	Test 1

## 8.6 Demodulation of DCH in downlink Transmit diversity modes

#### 8.6.1 Demodulation of DCH in open-loop transmit diversity mode

The receive characteristic of the Dedicated Channel (DCH) in open loop transmit diversity mode is determined by the Block Error Ratio (BLER). DCH is mapped into in Dedicated Physical Channel (DPCH).

#### 8.6.1.1 Minimum requirement

For the parameters specified in Table 8.19 the average downlink  $\frac{DPCH - E_c}{I_{or}}$  power ratio shall be below the specified

value for the BLER shown in Table 8.20. If the UE supports optional enhanced performance requirements type 1 for DCH then for the parameters specified in Table 8.20A the average downlink  $\frac{DPCH_{-}E_{c}}{I_{or}}$  power ratio shall be below the

specified value for the BLER shown in Table 8.20B and Test 1 shall be replaced by Test 1a.

### 8.6.2 Demodulation of DCH in closed loop transmit diversity mode

The receive characteristic of the dedicated channel (DCH) in closed loop transmit diversity mode is determined by the Block Error Ratio (BLER). DCH is mapped into in Dedicated Physical Channel (DPCH).

#### 8.6.2.1 Minimum requirement

For the parameters specified in Table 8.21 the average downlink <u>DPCH _ E_c</u> power ratio shall be below the specified

 $I_{or}$  value for the BLER shown in Table 8.22. If the UE supports optional enhanced performance requirements type1 for DCH then for the parameters specified in Table 8.22A the average downlink  $\frac{DPCH_{-}E_{c}}{I_{or}}$  power ratio shall be below the

specified value for the BLER shown in Table 8.22B and Test 1 shall be replaced by Test 1a.

## 8.7 Demodulation in Handover conditions

### 8.7.1 Demodulation of DCH in Inter-Cell Soft Handover

The bit error rate characteristics of UE is determined during an inter-cell soft handover. During the soft handover a UE receives signals from different cells. A UE has to be able to demodulate two PCCPCH channels and to combine the energy of DCH channels. Delay profiles of signals received from different cells are assumed to be the same but time shifted by 10 chips.

The receive characteristics of the different channels during inter-cell handover are determined by the average Block Error Ratio (BLER) values.

#### 8.7.1.1 Minimum requirement

For the parameters specified in Table 8.25 the average downlink  $\underline{DPCH_{-E_c}}_{I_{or}}$  power ratio shall be below the specified value for the BLER shown in Table 8.26. If the UE supports optional enhanced performance requirements type1 for

DCH then for the parameters specified in Table 8.26A the average downlink  $\frac{DPCH_{E_c}}{I_{or}}$  power ratio shall be below the

specified value for the BLER shown in Table 8.26B and Test 1 shall be replaced by Test 1a.

# 8.7.2 Combining of TPC commands from radio links of different radio link sets

### 8.7.2.1 Minimum requirement

Test parameters are specified in Table 8.27. The delay profiles of the signals received from the different cells are the same but time-shifted by 10 chips.

For Test 1, the sequence of uplink power changes between adjacent slots shall be as shown in Table 8.28 over the 4 consecutive slots more than 99% of the time. Note that this case is without an additional noise source  $I_{oc}$ .

For Test 2, the Cell1 and Cell2 TPC patterns are repeated a number of times. If the transmitted power of a given slot is increased compared to the previous slot, then a variable "Transmitted power UP" is increased by one, otherwise a variable "Transmitted power DOWN" is increased by one. The requirements for "Transmitted power UP" and "Transmitted power DOWN" are shown in Table 8.28A.

Parameter	Unit	Test 1	Test 2
Phase reference	-

# 8.7.3 Combining of reliable TPC commands from radio links of different radio link sets

### 8.7.3.1 Minimum requirement

Test 1 verifies that the UE follows only the reliable TPC commands in soft handover. Test 2 verifies that the UE follows all the reliable TPC commands in soft handover.

Test parameters are specified in Table 8.28B. Before the start of the tests, the UE transmit power shall be initialised to -15 dBm. An actual UE transmit power may vary from the target level of -15 dBm due to inaccurate UE output power step.

During tests 1 and 2 the UE transmit power samples, which are defined as the mean power over one timeslot, shall stay 90% of the time within the range defined in Table 8.28C.

Parameter	Unit	Test 1	Test 2
Phase reference	-	P-CF	PICH

Parameter	Unit	Test 1	Test 2
UE output power	dBm	-15 ± 5 dB	-15 ± 3 dB

### 8.8 Power control in downlink

Power control in the downlink is the ability of the UE receiver to converge to required link quality set by the network while using as low power as possible in downlink. If a BLER target has been assigned to a DCCH (See Annex A.3), then it has to be such that outer loop is based on DTCH and not on DCCH.

The requirements in this subclause were derived with the assumption that the UTRAN responds immediately to the uplink TPC commands by adjusting the power of the first pilot field of the DL DPCCH that commences after end of the received TPC command.

### 8.8.1 Power control in the downlink, constant BLER target

### 8.8.1.1 Minimum requirements

For the parameters specified in Table 8.29 the downlink  $\frac{DPCH_{E_c}}{I_{or}}$  power ratio measured values, which are averaged

over one slot, shall be below the specified value in Table 8.30 more than 90% of the time. BLER shall be as shown in Table 8.30. If the UE supports optional enhanced performance requirements type1 for DCH then for the parameters specified in Table 8.30A the downlink  $\frac{DPCH_{-}E_{c}}{I_{or}}$  power ratio measured values, which are averaged over one slot, shall

be below the specified value in Table 8.30B more than 90% of the time. BLER shall be as shown in Table 8.30B and Test 2 shall be replaced by Test 2a. Power control in downlink is ON during the test.

Parameter	Unit	Test 1	Test 2	Test 3	Test 4

### 8.8.2 Power control in the downlink, initial convergence

This requirement verifies that DL power control works properly during the first seconds after DPCH connection is established

112

### 8.8.2.1 Minimum requirements

For the parameters specified in Table 8.31 the downlink DPCH_Ec/Ior power ratio measured values, which are averaged over 50 ms, shall be within the range specified in Table 8.32 more than 90% of the time. For UE supporting the enhanced performance requirements type1 for DCH with the parameters specified in Table 8.32A the downlink DPCH_Ec/Ior power ratio measured values, which are averaged over 50 ms, shall be within the range specified in Table 8.32B more than 90% of the time. T1 equals to 500 ms and it starts 10 ms after the DPDCH physical channel is considered established and the first uplink frame is transmitted. T2 equals to 500 ms and it starts when T1 has expired. Power control is ON during the test. If the UE supports optional enhanced performance requirements type1 for DCH, Test 1, Test 2, Test 3 and Test 4 shall be replaced by Test 1a, Test 2a, Test 3a and Test 4a.

The first 10 ms shall not be used for averaging, ie the first sample to be input to the averaging filter is at the beginning of T1. The averaging shall be performed with a sliding rectangular window averaging filter. The window size of the averaging filter is linearly increased from 0 up to 50 ms during the first 50 ms of T1, and then kept equal to 50ms.

### 8.8.3 Power control in downlink, wind up effects

### 8.8.3.1 Minimum requirements

This test is run in three stages where stage 1 is for convergence of the power control loop. In stage two the maximum downlink power for the dedicated channel is limited not to be higher than the value specified in Table 8.33. All parameters used in the three stages are specified in Table 8.33. The downlink  $\underline{DPCH}_{-}E_{c}$  power ratio measured values,  $I_{or}$ 

which are averaged over one slot, during stage 3 shall be lower than the value specified in Table 8.34 more than 90% of the time.

Power control of the UE is ON during the test.

### 8.8.4 Power control in the downlink, different transport formats

### 8.8.4.1 Minimum requirements

Test 1 verifies that UE outer loop power control has proper behaviour with different transport formats.

The downlink reference measurement channel used in this subclause shall have two different transport formats. The different transport formats of the downlink reference measurement channel used shall correspond to the measurement channels specified in Annex A.3.0 and A.3.1. The transport format used in downlink reference measurement channel during different stages of the test shall be set according to the information data rates specified in Table 8.34A. During stage 1 a downlink transport format combination using the 12.2kbps information data rate DTCH shall be used, and during stage 2 the downlink transport format combination shall be changed such that a 0kbps information data rate transport format combination is then used.

For the parameters specified in Table 8.34A the downlink  $\frac{DPCH _ E_c}{I_{or}}$  power ratio measured values, which are averaged

over one slot, shall be below the specified value in Table 8.34B more than 90% of the time. BLER shall be as shown in Table 8.34B. Power control in downlink is ON during the test.

### 8.8.5 Power control in the downlink for F-DPCH

### 8.8.5.1 Minimum requirements

For the parameters specified in Table 8.34C the downlink  $\frac{F - DPCH - E_c}{I_{or}}$  power ratio measured values, which are averaged over TPC symbols of the F-DPCH frame, shall be below the specified value in Table 8.34D more than 90% of

the time. TPC command error ratio shall be in the limits given by Table 8.34D. Power control in downlink is ON during the tests.

### 8.9 Downlink compressed mode

Downlink compressed mode is used to create gaps in the downlink transmission, to allow the UE to make measurements on other frequencies.

The requirements in this subclause were derived with the assumption that the UTRAN responds immediately to the uplink TPC commands by adjusting the power of the first pilot field of the DL DPCCH that commences after end of the received TPC command.

### 8.9.1 Single link performance

The receiver single link performance of the Dedicated Traffic Channel (DCH) in compressed mode is determined by the Block Error Ratio (BLER) and transmitted DPCH_Ec/Ior power ratio in the downlink.

The compressed mode parameters are given in clause A.5.

### 8.9.1.1 Minimum requirements

For the parameters specified in Table 8.35 the downlink  $\frac{DPCH_{-}E_{c}}{I_{or}}$  power ratio measured values, which are averaged

over one slot, shall be below the specified value in Table 8.36 more than 90% of the time. The measured quality on DTCH shall be as required in Table 8.36.

Downlink power control is ON during the test. Uplink TPC commands shall be error free.

Table 8.36: Requirements in downlink compressed mode

### 8.10 Blind transport format detection

Performance of Blind transport format detection is determined by the Block Error Ratio (BLER) values and by the measured average transmitted DPCH_Ec/Ior value.

### 8.10.1 Minimum requirement

For the parameters specified in Table 8.37 the average downlink  $\frac{DPCH - E_c}{I_{or}}$  power ratio shall be below the specified value for the BLER shown in Table 8.38.

Table 8.37: Test parameters for Blind transport format detection

DCCH	2.4k								

### 8.11 Detection of Broadcast channel (BCH)

The receiver characteristics of Broadcast Channel (BCH) are determined by the Block Error Ratio (BLER) values. BCH is mapped into the primary common control physical channel (P-CCPCH).

### 8.11.1 Minimum requirement without transmit diversity

For the parameters specified in Table 8.40 the average downlink power P-CCPCH_Ec/Ior shall be below the specified value for the BLER shown in Table 8.41. (The Down link Physical channels are specified in Annex C).

This requirement doesn"t need to be tested.

Parameter	Unit	Test 1	Test 2
Phase reference	-	P-CPICH	
I _{oc}	dBm/3.84 MHz	-60	
$\hat{I}_{or}/I_{oc}$	dB	-1	-3

Test Number	P-CCPCH_Ec/lor	BLER
1	-18.5 dB	0.01
2	-12.8 dB	0.01

### 8.11.2 Minimum requirement with open loop transmit diversity

For the parameters specified in Table 8.41A the average downlink power P-CCPCH_Ec/Ior shall be below the specified value for the BLER shown in Table 8.41B. (The Down link Physical channels are specified in Annex C).

This requirement doesn"t need to be tested.

### Table 8.41A: Test parameters for BCH detection in an open loop transmit diversity scheme (STTD). (Propagation condition: Case 1)

Parameter	Unit	Test 3
Phase reference	-	P-CPICH

Table 8.41B: Test requirements for BCH detection in open loop transmit diversity scheme

Test Number	P-CCPCH_Ec/lor (Total power from antenna 1 and 2)	BLER
3	-18.5	0.01

### 8.12 Demodulation of Paging Channel (PCH)

The receiver characteristics of paging channel are determined by the probability of missed paging message (Pm-p). PCH is mapped into the S-CCPCH and it is associated with the transmission of Paging Indicators (PI) to support efficient sleep-mode procedures.

### 8.12.1 Minimum requirement

For the parameters specified in Table 8.42 the average probability of missed paging (Pm-p) shall be below the specified value in Table 8.43. Power of downlink channels other than S-CCPCH and PICH are as defined in Table C.3 of Annex C. S-CCPCH structure is as defined in Annex A.6.

Parameter	Unit	Test 1	Test 2
Number of paging indicators per frame (Np)	-	72	
Phase reference	-	P-CPICH	
I _{oc}	dBm/3.84 MHz	-60	
$\hat{I}_{or}/I_{oc}$	dB	-1	-3
Propagation condition		Static	Case 3

#### Table 8.42: Parameters for PCH detection

Test Number	S-CCPCH_Ec/lor	PICH_Ec/lor	Pm-p
1	-14.8	-19	0.01
2	-9.8	-12	0.01

### 8.13 Detection of Acquisition Indicator (AI)

The receiver characteristics of Acquisition Indicator (AI) are determined by the probability of false alarm Pfa and probability of correct detection Pd. Pfa is defined as a conditional probability of detection of AI signature given that a AI signature was not transmitted. Pd is defined as a conditional probability of correct detection of AI signature given that the AI signature is transmitted.

### 8.13.1 Minimum requirement

For the parameters specified in Table8.44 the Pfa and 1-Pd shall not the exceed the specified values in Table 8.45. Power of downlink channels other than AICH is as defined in Table C.3 of Annex C.

Parameter	Unit	Test 1
Phase reference	-	P-CPICH
$I_{oc}$	dBm/3.84 MHz	-60
Number of other transmitted AI signatures on AICH	-	0
$\hat{I}_{or}/I_{oc}$	dB	-1
AICH_Ec/lor	dB	-22.0
AICH Power Offset	dB	-12.0
Propagation condition	-	Static

Table 8.44:	Parameters for	Al detection
-------------	----------------	--------------

Note that AICH_Ec/Ior can not be set. Its value is calculated from other parameters and it is given for information only. (AICH_Ec/Ior = AICH Power Offset + CPICH_Ec/Ior)

Table 8.45: Test requirements for AI detection

Test Number	Pfa	1-Pd	
1	0.01	0.01	

### 8.13A Detection of E-DCH Acquisition Indicator (E-AI)

The receiver characteristics of E-DCH Acquisition Indicator (E-AI) are determined by the probability of correct detection Pde. Pde is defined as a conditional probability of correct detection of E-AI signature given that the E-AI signature is transmitted and AI signature was correctly received.

### 8.13A.1 Minimum requirement

For the parameters specified in Table 8.45C the 1-Pde shall not exceed the specified value in Table 8.45D. The power settings for downlink channels other than AICH and E-AICH are set as defined in Table C.3 of Annex C.

Parameter	Unit	Test 1	
Phase reference	-	P-CPICH	
I _{oc}	dBm/3.84 MHz	-60	
Number of other transmitted AI signatures on AICH	-	0	
Number of resources assumed for E-DCH random access	-	32	
$\hat{I}_{or}/I_{oc}$	dB	-1	
AICH_Ec/lor	dB	-22.0	
AICH Power Offset	dB	-12.0	
E-AICH_Ec/lor	dB	-22.0	
E-AICH Power Offset	dB	-12.0	
Propagation condition	-	Static

# 8.14 UE UL power control operation with discontinuous UL DPCCH transmission operation

### 8.14.1 Minimum requirement

This test verifies that the UE follows only those TPC commands that correspond to the UL DPCCH slots which are transmitted.

Test parameters are specified in Table 8.45A. The discontinuous UL DPCCH transmission is enabled during the test. The parameters for discontinuous UL DPCCH transmission operation are as specified in Table A.20A. Before the start of the tests, the UE transmit power shall be initialised to -15 dBm. An actual UE transmit power may vary from the target level of -15 dBm due to inaccurate UE output power step.

After transmission gaps due to discontinuous uplink DPCCH transmission the uplink transmitter power difference shall be within the range as defined in Table 8.45B. The transmit power difference is defined as the difference between the power of the last slot transmitted before the gap and the power of first slot transmitted after the gap. The on power observation period is defined as the mean power over one timeslot excluding any transient periods.

### Table 8.45A: Parameters for UE UL power control operation with discontinuous UL DPCCH transmission

Parameter	Unit	Test 1	
Phase reference	-	P-CPICH	
HS-SCCH_1 $E_c / I_{or}$	dB	-10

### 9 Performance requirement (HSDPA)

The performance requirements for the UE in this clause apply for the reference measurement channels specified in Annex A.7, the propagation conditions specified in Annex B.2.2 and the Down link Physical channels specified in Annex C.5. The specific references are provided separately for each requirement.

Unless otherwise stated the performance requirements are specified at the antenna connector of the UE. For UE(s) with an integral antenna only, a reference antenna with a gain of 0 dBi is assumed. UE with an integral antenna may be taken into account by converting these power levels into field strength requirements, assuming a 0 dBi gain antenna. For UEs with more than one antenna connector testing the fading of the signals and the AWGN signals applied to each receiver antenna connector shall be uncorrelated. The levels of the test signal applied to each of the antenna connectors shall be as defined in the respective sections below.

### 9.1 (void)

### 9.2 Demodulation of HS-DSCH (Fixed Reference Channel)

The minimum performance requirement for a particular UE supporting one of the HS-DSCH categories 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 or 12 are determined according to Table 9.1.

The minimum performance requirements for a particular UE supporting one of the HS-DSCH categories 1, 2, 3, 4, 5, 6, 7, 8, 9 or 10 and supporting the optional enhanced performance requirements type 1 are determined according to Table 9.1AA.

The minimum performance requirements for a particular UE supporting one of the HS-DSCH categories 7, 8, 9 or 10 and supporting the optional enhanced performance requirements type 2 are determined according to Table 9.1AB.

The minimum performance requirements for a particular UE supporting HS-DSCH category 13 or 14 are determined according to Table 9.1AB.

The minimum performance requirements for a particular UE supporting one of the HS-DSCH categories 7, 8, 9, 10, 13 or 14 and supporting the optional enhanced performance requirements type 3 are determined according to Table 9.1AC.

The minimum performance requirements for a particular UE supporting one of the HS-DSCH categories 15, 16, 17, 18, 19 or 20 are determined according to Table 9.1AC.

The minimum performance requirements for a particular UE supporting one of the HS-DSCH categories 7, 8, 9, 10, 13, 14, 15, 16, 17, 18, 19 or 20 and supporting the optional enhanced performance requirements type 3i are determined according to Table 9.1AD.

The minimum performance requirements for a particular UE supporting one of the HS-DSCH categories 21, 22, 23 and 24 are determined according to Table 9.1 AE.

The minimum performance requirements for a particular UE supporting one of the HS-DSCH categories 21, 22, 23, 24, 25, 26, 27 or 28 and supporting the optional enhanced performance requirements type 3 are determined according to Table 9.1 AF.

The minimum performance requirements for a particular UE supporting one of the HS-DSCH categories 21, 22, 23, 24, 25, 26, 27 or 28 and supporting the optional enhanced performance requirements type 3i are determined according to Table 9.1 AG.

A UE supporting one of categories 21, 22 23 or 24 shall support either enhanced receiver type 2 requirements, or enhanced receiver type 3 requirements, or enhanced receiver type 3 requirements applicable for the other categories supported by this UE.

A UE supporting one of categories 21, 22 23 or 24 supporting enhanced receiver type 3 requirements shall support either enhanced receiver type 3 requirements, or enhanced receiver type 3 requirements applicable for the other categories supported by this UE.

A UE supporting one of categories 21, 22 23 or 24 supporting enhanced receiver type 3i requirements shall support enhanced receiver type 3i requirements applicable for the other categories supported by this UE.

The additional minimum performance requirements for UE supporting one of the HS-DSCH categories 7, 8, 9, 10, 13, 14, 21, 22, 23 and 24 and the MIMO only with single-stream restriction are indicated in Table 9.1AB, Table 9.1AC, 9.1AD, Table 9.1AE, Table 9.1AF and Table 9.1AG.

For the requirements for UEs supporting HS-DSCH categories 21, 22, 23, 24, 25, 26, 27 or 28, when the carriers are located in the same frequency band, the spacing of the carrier frequencies of the two cells shall be 5 MHz.

All aforementioned requirements are applicable to the UE when in CELL_DCH state. Minimum performance requirements for UE being able to receive HS-DSCH and HS-SCCH in CELL_FACH state are given in Section 9.6.

The propagation conditions for this subclause are defined in table B.1B.

#### Table 9.1AG: FRC for enhanced performance requirements type 3i for different DC-HSDPA and DB-DC-HSDPA categories

During the Fixed Reference Channel tests the behaviour of the Node-B emulator in response to the ACK/NACK signalling field of the HS-DPCCH is specified in Table 9.1A:

Table 9.1A: Node-B Emulator Behaviour in response to ACK/NACK/DTX

HS-DPCCH ACK/NACK Field State	Node-B Emulator Behaviour
ACK	ACK: new transmission using 1 st
	redundancy and constellation version (RV)
NACK	NACK: retransmission using the next RV (up to the maximum permitted number or RV"s)
DTX	DTX: retransmission using the RV
	previously transmitted to the same H-ARQ
	process

NOTE: Performance requirements in this section assume a sufficient power allocation to HS-SCCH_1 so that probability of reporting DTX is very low.

### 9.2.1 Single Link performance

The receiver single link performance of the High Speed Physical Downlink Shared Channel (HS-DSCH) in different multi-path fading environments are determined by the information bit throughput R

### 9.2.1.1 Requirement QPSK, Fixed Reference Channel (FRC) H-Set 1/2/3/3A

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels Hset 1/2/3/3A (QPSK version) specified in Annex A.7.1.1, A.7.1.2 and A.7.1.3 respectively, with the addition of the parameters in Table 9.2 and the downlink physical channel setup according to table C.8.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.3. Enhanced performance requirements type 1 specified in Table 9.3A are based on receiver diversity.

### 9.2.1.3 Minimum requirement QPSK, Fixed Reference Channel (FRC) H-Set 4/5

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels Hset 4/5 specified in Annex A.7.1.4 and A.7.1.5 respectively, with the addition of the parameters in Table 9.6 and the downlink physical channel setup according to table C.8.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.7 for H-Set 4 and table 9.8 for H-Set 5.

Parameter	Unit	Test 1	Test 2	Test 3	Test 4
Phase reference			P-CI	PICH	
I _{oc}	dBm/3.84 MHz		-6	60	
Redundancy and constellation version coding sequence		{0,2,5,6}			
Maximum number of HARQ transmission		4			
Note: The HS-SCCH-1 and HS-PDSCH shall be transmitted continuously with constant power. HS-SCCH-1 shall only use the identity of the UE under test f those TTI intended for the UE.

### 9.2.1.4 Requirement QPSK, Fixed Reference Channel (FRC) H-Set 6/6A

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channel H-Set 6/6A specified in Annex A.7.1.6 with the addition of the parameters in Table 9.8A and the downlink physical channel setup according to table C.8.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.8B. Enhanced performance requirements type 1 as specified in Table 9.8B1 are based on receiver diversity. Enhanced performance requirements type 2 as specified in Table 9.8B2 are based on chip level equaliser. Enhanced performance requirements type 3 as specified in Table 9.8B3 and in Table 9.8B4 are based on receiver diversity and chip level equaliser. Enhanced performance requirements type 3 is specified in Table 9.8B5 are based on receiver diversity and interference-aware chip level equaliser.

Parameter	Unit	Test 1	Test 2	Test 3	Test 4
Phase reference			P-CI	PICH	
I _{oc}	dBm/3.84 MHz		-6	60	
Redundancy and constellation version coding sequence			{0,2	,5,6}	
Maximum number of HARQ transmission		4			
Note: The HS-SCCH-1 and HS-PDSCH shall be transmitted continuously with const power. HS-SCCH-1 shall only use the identity of the UE under test for those T intended for the UE.

Note 3:	For Fixed Reference Channel (FRC) H-Set 6A the reference values for R should be scaled (multiplied by 2.0)		

### 9.2.1.5 Requirement 16QAM, Fixed Reference Channel (FRC) H-Set 6/6A

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channel H Set-6/6A specified in Annex A.7.1.6 with the addition of the parameters in Table 9.8C and the downlink physical channel setup according to table C.8.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.8D. Enhanced performance requirements type 1 as specified in Table 9.8D1 are based on receiver diversity. Enhanced

performance requirements type 2 as specified in Table 9.8D2 are based on chip level equaliser. Enhanced performance requirements type 3 as specified in Table 9.8D3 and in Table 9.8D4 are based on receiver diversity and chip level equaliser.

### 9.2.1.6 Requirement 64QAM, Fixed Reference Channel (FRC) H-Set 8/8A

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channel H Set-8/8A specified in Annex A.7.1.7 with the addition of the parameters in Table 9.8E and the downlink physical channel setup according to table C.8.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.8F2 and 9.8F3. Enhanced performance requirements type 2 as specified in Table 9.8F2 are based on chip level equaliser. Enhanced performance requirements type 3 as specified in Table 9.8F3 are based on receiver diversity and chip level equaliser.

Parameter	Unit	Test 1

### 9.2.1.7 Requirement QPSK, Fixed Reference Channel (FRC) H-Set 10/10A

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channel H Set-10/10A specified in Annex A.7.1.10 with the addition of the parameters in Table 9.8G and the downlink physical channel setup according to table C.8.

Using this configuration the throughput shall meet or exceed the minimum performance requirements as specified in table 9.8H and table 9.8H1. Enhanced performance requirements type 2 as specified in Table 9.8H are based on chip level equaliser. Enhanced performance requirements type 3 as specified in Table 9.8H1 are based on receiver diversity and chip level equaliser.

### 9.2.1.8 Requirement 16QAM, Fixed Reference Channel (FRC) H-Set 10/10A

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channel H Set-10/10A specified in Annex A.7.1.10 with the addition of the parameters in Table 9.8I and the downlink physical channel setup according to table C.8.

Using this configuration the throughput shall meet or exceed the minimum performance requirements as specified in table 9.8J and table 9.8J1. Enhanced performance requirements type 2 as specified in Table 9.8J are based on chip level equaliser. Enhanced performance requirements type 3 as specified in Table 9.8J1 are based on receiver diversity and chip level equaliser.

Parameter	Unit	Test 1		
Phase reference		P-CPICH		
I _{oc}	dBm/3.84 MHz	-60

	1)The reference value R is for the Fixed Reference Channel (FRC) H-Set 10 2) For Fixed Reference Channel (FRC) H-Set 10A the reference values for should be scaled (multiplied by 2.0)				

### 9.2.2 Open Loop Diversity performance

The receiver single open loop transmit diversity performance of the High Speed Physical Downlink Shared Channel (HS-DSCH) in multi-path fading environments are determined by the information bit throughput R.

### 9.2.2.1 Requirement QPSK, Fixed Reference Channel (FRC) H-Set 1/2/3/3A

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels H-Set  $\frac{1}{2}/3/3$ A (QPSK version) specified in Annex A.7.1.1, A.7.1.2 and A.7.1.3 respectively, with the addition of the parameters in Table 9.9 and the downlink physical channel setup according to table C.9.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.10. Enhanced performance requirements type 1 specified in Table 9.10A are based on receiver diversity.

### Table 9.9: Test Parameters for Testing QPSK FRCs H-Set 1/H-Set 2/H-Set 3/H-Set 3A

## 9.2.3 Closed Loop Diversity Performance

The closed loop transmit diversity (Mode 1) performance of the High Speed Physical Downlink Shared Channel (HS-DSCH) in multi-path fading environments are determined by the information bit throughput R.

## 9.2.3.1 Requirement QPSK, Fixed Reference Channel (FRC) H-Set 1/2/3

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels H-Set  $\frac{1}{2}$  (QPSK version) specified in Annex A.7.1.1, A.7.1.2 and A.7.1.3 respectively, with the addition of the parameters in Table 9.16 and the downlink physical channel setup according to table C.10.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.17. Enhanced performance requirements type 1 specified in Table 9.17A are based on receiver diversity.

## 9.2.3.2 Requirement 16QAM, Fixed Reference Channel (FRC) H-Set 1/2/3

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels Hset  $\frac{1}{2}$  (16QAM version) specified in Annex A.7.1.1, A.7.1.2 and A.7.1.3 respectively, with the addition of the parameters in Table 9.18 and the downlink physical channel setup according to table C.10.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.19. Enhanced performance requirements type 1 specified in Table 9.19A are based on receiver diversity.

## 9.2.4 MIMO Performance

The MIMO performance of the High Speed Physical Downlink Shared Channel (HS-DSCH) in multi-path fading environments are determined by the information bit throughput R.

### 9.2.4.1 Requirement Fixed Reference Channel (FRC) H-Set 9/9A

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels H-Set 9/9A specified in Annex A.7.1.9, with the addition of the parameters in Table 9.22E1 and the downlink physical channel setup according to Table C.9 and Table C.12D. Precoding weight set restriction shall be enabled for the tests with the downlink physical channel setup according to Table C.12D, defined in Table 9.22E3. Precoding weight set restriction shall not be enabled for the tests with the downlink physical channel setup according to Table 0.22E3. Precoding to Table C.9, defined in Table 9.22E2.

The primary precoding vector signalled on the HS-SCCH and applied on the associated HS-DSCH subframe shall correspond to the preferred primary precoding vector reported immediately before the start of the HS-SCCH subframe.

The determination of applied precoding vector for single transport block transmission shall be as follows: the reported preferred primary precoding vector shall be applied to the primary transport block.

The determination of applied precoding vector for two transport block transmission shall be as follows: If the CQI reported by the UE indicates a preference for a single transport block, the preferred primary precoding vector shall be applied to the primary transport block. If the CQI reported by the UE indicates a preference for two transport blocks, and the preferred primary precoding vector corresponds to the highest reported CQI value, the preferred primary precoding vector shall be applied to the primary precoding vector corresponds to the highest reported by the UE indicates a preference for two transport blocks, and the preferred primary precoding vector shall be applied to the primary precoding vector does not correspond to the highest reported CQI value, the preferred primary precoding vector shall be applied to the secondary transport block.

The throughput for Test 3 and Test 4 with the downlink physical channel setup according to Table C.12D and defined in Table 9.22E3, shall be collected with any HS-DSCH subframe where the applied precoding vector corresponds to the single transport block Type A CQI report or the Type B CQI report.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in Table 9.22E2 with the downlink physical channel setup in Table C.9, and the minimum requirements specified in Table 9.22E3 with the downlink physical channel setup in Table C.12D.

### 9.2.4.2 Requirement Fixed Reference Channel (FRC) H-Set 11/11A

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels H-Set 11/11A specified in Annex A.7.1.11, with the addition of the parameters in Table 9.22F1 and the downlink physical channel setup according to Table C.9 and Table C.12D. Precoding weight set restriction shall be enabled for the tests with the downlink physical channel setup according to Table C.12D, defined in Table 9.22F3. Precoding weight set restriction shall not be enabled for the tests with the downlink physical channel setup according to Table C.9, defined in Table 9.22F2.

The primary precoding vector signalled on the HS-SCCH and applied on the associated HS-DSCH subframe shall correspond to the preferred primary precoding vector reported immediately before the start of the HS-SCCH subframe.

The determination of applied precoding vector for two transport block transmission shall be as follows: If the CQI reported by the UE indicates a preference for a single transport block, the preferred primary precoding vector shall be applied to the primary transport block. If the CQI reported by the UE indicates a preference for two transport blocks, and the preferred primary precoding vector corresponds to the highest reported CQI value, the preferred primary precoding vector shall be applied to the primary transport block. If the CQI reported by the UE indicates a preference for two transport blocks, and the preferred primary precoding vector corresponds to the highest reported by the UE indicates a preference for two transport blocks, and the preferred primary precoding vector does not correspond to the highest reported CQI value, the preferred primary precoding vector shall be applied to the secondary transport block.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in Table 9.22F2 with the downlink physical channel setup in Table C.9, and the minimum requirements specified in Table 9.22F3 with the downlink physical channel setup in Table C.12D.

## 9.2.4A MIMO only with single-stream restriction Performance

The MIMO only with single-stream performance of the High Speed Physical Downlink Shared Channel (HS-DSCH) in multi-path fading environments are determined by the information bit throughput R.

## 9.2.4A.1 Requirement QPSK, Fixed Reference Channel (FRC) H-Set 1/1A

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels Hset 1/1A (QPSK version) specified in Annex A.7.1.1, with the addition of the parameters in Table 9.22G1 and the downlink physical channel setup according to Table C.9 and Table C.12D. Precoding weight set restriction shall be enabled for the tests with the downlink physical channel setup according to Table C.12D, defined in Table 9.22G2A and Table 9.22G4. Precoding weight set restriction shall not be enabled for the tests with the downlink physical channel setup according to Table C.9, defined in Table 9.22G2 and Table 9.22G3.

The primary precoding vector signalled on the HS-SCCH and applied on the associated HS-DSCH subframe shall correspond to the preferred primary precoding vector reported immediately before the start of the HS-SCCH subframe.

The determination of applied precoding vector for single transport block transmission shall be as follows: the reported preferred primary precoding vector shall be applied to the primary transport block.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in Table 9.22G2 with the downlink physical channel setup in Table C.9, and the minimum requirements specified in Table 9.22G2A with the downlink physical channel setup in Table C.12D. If UE supports enhanced performance requirements type 3, the throughput shall meet or exceed the minimum requirements specified in Table 9.22G3 with the downlink physical channel setup in Table C.12D. If UE supports enhanced performance requirements type 3, the throughput shall meet or exceed the minimum requirements specified in Table 9.22G3 with the downlink physical channel setup in Table C.9, and the minimum requirements specified in Table 9.22G4 with the downlink physical channel setup in Table C.12D. The performance requirements specified in Table 9.22G2 and Table 9.22G2A are based on chip level equaliser and the performance requirements specified in Table 9.22G3 and Table 9.22G4 are based on chip level equaliser with receiver diversity.

### 9.2.4A.2 Requirement 16QAM, Fixed Reference Channel (FRC) H-Set 1/1A

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels Hset 1/1A (16QAM version) specified in Annex A.7.1.1, with the addition of the parameters in Table 9.22H1 and the downlink physical channel setup according to Table C.9 and Table C.12D. Precoding weight set restriction shall be enabled for the tests with the downlink physical channel setup according to Table C.12D, defined in Table 9.22H2A and 9.22H4. Precoding weight set restriction shall not be enabled for the tests with the downlink physical channel setup according to Table C.9, defined in Table 9.22H2 and Table 9.22H3.

The primary precoding vector signalled on the HS-SCCH and applied on the associated HS-DSCH subframe shall correspond to the preferred primary precoding vector reported immediately before the start of the HS-SCCH subframe.

The determination of applied precoding vector for single transport block transmission shall be as follows: the reported preferred primary precoding vector shall be applied to the primary transport block.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in Table 9.22H2 with the downlink physical channel setup in Table C.9, and the minimum requirements specified in Table 9.22H2A with the downlink physical channel setup in Table C.12D. If UE supports enhanced performance requirements type 3, the throughput shall meet or exceed the minimum requirements specified in Table 9.22H3 with the downlink physical channel setup in Table C.12D. If UE supports enhanced performance requirements type 3, the throughput shall meet or exceed the minimum requirements specified in Table 9.22H3 with the downlink physical channel setup in Table C.9, and the minimum requirements specified in Table 9.22H4 with the downlink physical channel setup in Table C.12D. The performance requirements specified in Table 9.22H2 and Table 9.22H2A are based on chip level equaliser and the performance requirements specified in Table 9.22H3 and Table 9.22H4 are based on chip level equaliser with receiver diversity.

## 9.3 Reporting of Channel Quality Indicator

The propagation conditions for this subclause are defined in table B.1C for non-MIMO operation under fading conditions, in subclause B.2.6.1 for MIMO operation under single stream conditions, and in subclause B.2.6.2 for MIMO operation under dual stream conditions.

For the cases in this subclause where CQI reporting is evaluated under fading conditions or under MIMO single/dual stream conditions it is expected that the UE will not always detect the HS-SCCH, resulting in a DTX for the uplink ACK/NACK transmission. The downlink configuration for evaluating CQI performance does not use retransmission. Therefore any BLER calculations must exclude any packets where the UE may have attempted to combine data from more than one transmission due to having missed one or more new data indicators or initial transmissions in MIMO operation from lost HS-SCCH transmissions.

For the requirements for UEs supporting HS-DSCH categories 21, 22, 23, 24, 25, 26, 27 or 28, when the carriers are located in the same frequency band, the spacing of the carrier frequencies of the two cells shall be 5 MHz.

## 9.3.1 Single Link Performance

### 9.3.1.1 AWGN propagation conditions

The reporting accuracy of channel quality indicator (CQI) under AWGN environments is determined by the reporting variance and the BLER performance using the transport format indicated by the reported CQI median.

### 9.3.1.1.1 Minimum Requirement – UE HS-DSCH categories 1-20

For the parameters specified in Table 9.23, and using the downlink physical channels specified in table C.8, the reported CQI value shall be in the range of +/-2 of the reported median more than 90% of the time. If the HS-PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1, the BLER using the transport format indicated by the (median CQI +2) shall be greater than 0.1. If the HS-PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI -1) shall be less than or equal to 0.1.

### 9.3.1.2 Fading propagation conditions

The reporting accuracy of the channel quality indicator (CQI) under fading environments is determined by the BLER performance using the transport format indicated by the reported CQI median.

The specified requirements may be subject to further simulations to verify assumptions.

### 9.3.1.2.1 Minimum Requirement – UE HS-DSCH categories 1-20

For the parameters specified in Table 9.26, and using the downlink physical channels specified in table C.8, the requirements are specified in terms of maximum BLERs at particular reported CQIs when transmitting a fixed transport format given by the CQI median as shown in Table 9.27. The BLER at a particular reported CQI is obtained by associating a particular CQI reference measurement period with the HS-PDSCH subframe overlapping with the end of this CQI reference measurement period and calculating the fraction of erroneous HS-PDSCH subframes.

CQI median + 3	15%		

# 9.3.1.2.3 Additional Requirements – UE HS-DSCH categories 21, 22, 23, 24, 25, 26, 27 and 28

For the parameters specified in Table 9.26, and using the downlink physical channels specified in table C.8, with both primary and secondary serving cells configured, for each of the serving cells, the requirements are specified in terms of maximum BLERs at particular reported CQIs for each serving cell when transmitting with a cell-specific fixed transport format given by the cell-specific CQI median as shown in Table 9.27. The BLER at a particular reported CQI for a specific serving cell is obtained by associating a particular CQI reference measurement period with the HS-PDSCH subframe transmitted from this serving cell overlapping with the end of this CQI reference measurement period and calculating the fraction of erroneous HS-PDSCH subframes.

### 9.3.1.3 Periodically varying radio conditions.

The reporting accuracy of the channel quality indicator (CQI) when subject to AWGN propagation conditions with periodically varying  $\hat{I}_{or}/I_{oc}$ , is determined by the reporting variance as measured during selected parts of a predetermined  $\hat{I}_{or}/I_{oc}$  pattern, as depicted in Figure 9.1.

# Figure 9.1 Test scenario for CQI reporting test under varying interference conditions. $\hat{I}_{or} / I_{oc}$ is varied between $\alpha 1$ and $\alpha 2$ according to a predetermined square wave pattern.

#### 9.3.1.3.1 Minimum Requirement – UE HS-DSCH categories 1-20

For the parameters specified in Table 9.27C, and using the downlink physical channels specified in table C.8, let  $M_1$  be defined as the median CQI that the UE reports in static propagation conditions, with Ior/Ioc set to  $\alpha_1$ , and  $M_2$  be the median CQI that the UE reports in static propagation conditions, with  $\hat{I}_{or}/I_{oc}$  set to  $\alpha_2$ . The minimum difference between  $M_1$  and  $M_2$  is required to be larger than 6.

For the parameters specified in Table 9.27C, and using the downlink physical channels specified in table C.8, 90% of the reported CQI values, during  $T_{\text{measure}}$  as depicted in Figure 9.1, shall be in the range of +/-3 of M1, for the cases when  $T_{\text{measure}}$  occurs during time-periods where  $\hat{I}_{or}/I_{oc}$  is set to  $\alpha_1$ , and in the range of +/-3 of M2, for the cases when  $T_{\text{measure}}$  occurs during time-periods where  $\hat{I}_{or}/I_{oc}$  is set to  $\alpha_2$ .

The measurement equipment is allowed to start the ramping of  $\hat{I}_{or}/I_{oc}$  13 slots before the start of the HS-DPCCH slot that contains the first CQI report in T_{measure}.

The measurement equipment shall have settled  $\hat{I}_{or}/I_{oc}$  to its nominal value 10 slots before the start of the HS-DPCCH slot that contains the first CQI report in T_{measure}.

An illustration of these timing relations is provided in Figure 9.2.

CQI repetition factor	-	1	
HS-SCCH-1 signalling pattern	-	To incorporate inter-TTI=3 the six sub- frame HS-SCCH-1 signalling pattern shall be 'XOOXOO', where 'X' indicates TTI in which the HS-SCCH-1 uses the identity of the UE under test, and 'O' indicates TTI in which the HS-SCCH-1 uses a different UE identity.	
<ul> <li>Note 1: Measurement power offset 'Γ' is configured by RRC accordingly and as defined in [7]</li> <li>Note 2: The UE shall be configured in non-64QAM/non-MIMO mode and use appropriate CQI tables according to TS 25.214.</li> </ul>			

### Table 9.27C: Test Parameter for CQI test in periodically varying radio conditions - single link

Figure 9.2 Timing relation between HS-DPCCH, DPCCH/DPDCH and  $\hat{I}_{or}/I_{oc}$  ramping. The measurement equipment starts ramping the  $\hat{I}_{or}/I_{oc}$  at point 1. The  $\hat{I}_{or}/I_{oc}$  should be settled to its nominal value at point 2. The first CQI report that is counted in the statistics of the requirement is transmitted in the uplink at point 3.

## 9.3.2 Open Loop Diversity Performance

### 9.3.2.1 AWGN propagation conditions

The reporting accuracy of channel quality indicator (CQI) under AWGN environments is determined by the reporting variance and the BLER performance using the transport format indicated by the reported CQI median.

### 9.3.2.1.1 Minimum Requirement – UE HS-DSCH categories 1-20

For the parameters specified in Table 9.32, and using the downlink physical channels specified in table C.9, the reported CQI value shall be in the range of +/-2 of the reported median more than 90% of the time. If the HS-PDSCH (BLER) using the transport format indicated by median CQI is less than or equal to 0.1, the BLER using the transport format indicated by the (median CQI +2) shall be greater than 0.1. If the HS-PDSCH (BLER) using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI -1) shall be less than or equal to 0.1.

Table 9.33: Test Parameter for CQI test in AWGN – open loop diversity

### 9.3.2.2 Fading propagation conditions

The reporting accuracy of the channel quality indicator (CQI) under fading environments is determined by the BLER performance using the transport format indicated by the reported CQI median.

The specified requirements may be subject to further simulations to verify assumptions.

### 9.3.2.2.1 Minimum Requirement – UE HS-DSCH categories 1-20

For the parameters specified in Table 9.35, and using the downlink physical channels specified in table C.9, the requirements are specified in terms of maximum BLERs at particular reported CQIs when transmitting a fixed transport format given by the CQI median as shown in Table 9.36. The BLER at a particular reported CQI is obtained by associating a particular CQI reference measurement period with the HS-PDSCH subframe overlapping with the end of this CQI reference measurement period and calculating the fraction of erroneous HS-PDSCH subframes.

### 9.3.2.2.2 Additional Requirements – UE HS-DSCH categories 21, 22, 23, 24, 25, 26, 27 and 28

For the parameters specified in Table 9.35 and using the downlink physical channels specified in table C.9, with both primary and secondary serving cells configured, for each of the serving cells, the requirements are specified in terms of maximum BLERs at particular reported CQIs for each serving cell when transmitting with a cell-specific fixed transport format given by the cell-specific CQI median as shown in Table 9.36. The BLER at a particular reported CQI for a specific serving cell is obtained by associating a particular CQI reference measurement period with the HS-PDSCH subframe transmitted from this serving cell overlapping with the end of this CQI reference measurement period and calculating the fraction of erroneous HS-PDSCH subframes.

166

### 9.3.2.3 Periodically varying radio conditions.

The reporting accuracy of the channel quality indicator (CQI) when subject to AWGN propagation conditions with periodically varying  $\hat{I}_{or}/I_{oc}$ , is determined by the reporting variance as measured during selected parts of a predetermined  $\hat{I}_{or}/I_{oc}$  pattern, as depicted in Figure 9.1.

### 9.3.2.3.1 Minimum Requirement – UE HS-DSCH categories 1-20

For the parameters specified in Table 9.37, and using the downlink physical channels specified in table C.9, let  $M_1$  be defined as the median CQI that the UE reports in static propagation conditions, with Ior/Ioc set to  $\alpha_1$ , and  $M_2$  be the median CQI that the UE reports in static propagation conditions, with  $\hat{I}_{or}/I_{oc}$  set to  $\alpha_2$ . The minimum difference between  $M_1$  and  $M_2$  is required to be larger than 6.

For the parameters specified in Table 9.37, and using the downlink physical channels specified in table C.9, 90% of the reported CQI values, during  $T_{measure}$  as depicted in Figure 9.1, shall be in the range of +/-3 of M1, for the cases when  $T_{measure}$  occurs during time-periods where  $\hat{I}_{or}/I_{oc}$  is set to  $\alpha_1$ , and in the range of +/-3 of M2, for the cases when  $T_{measure}$  occurs during time-periods where  $\hat{I}_{or}/I_{oc}$  is set to  $\alpha_2$ .

The measurement equipment is allowed to start the ramping of  $\hat{I}_{or}/I_{oc}$  13 slots before the start of the HS-DPCCH slot that contains the first CQI report in T_{measure}.

The measurement equipment shall have settled  $\hat{I}_{or}/I_{oc}$  to its nominal value 10 slots before the start of the HS-DPCCH slot that contains the first CQI report in T_{measure}.

An illustration of these timing relations is provided in Figure 9.2.

# Table 9.45A: Test Parameter for CQI test in periodically varying radio conditions – closed loop diversity

## 9.3.4 MIMO Performance

## 9.3.4.1 MIMO Single Stream Fading Conditions

The minimum performance requirements of channel quality indicator (CQI) reporting under MIMO single stream conditions are defined based on a CQI Type A versus Type B reporting ratio of 1/2, i.e. the parameters  $N_cqi_typeA$  and  $M_cqi$  (see [8]) are assumed to be set to 1 and 2, respectively. The propagation conditions assumed for minimum performance requirements of CQI reporting under MIMO single stream conditions are defined in subclause B.2.6.1. The precoding used at the transmitter is one randomly picked but fixed precoding vector for single transport block transmission out of the set of possible precoding vectors as defined in [8]. The same precoding vector shall be used to generate the resulting channel coefficients as described for MIMO single stream conditions in subclause B.2.6.1.

The reporting accuracy of CQI under MIMO single stream conditions is determined by the BLER performance when transmitting with a transport format indicated by the reported CQI median determined over all single transport block Type A CQI reports and all Type B CQI reports that were reported together with PCI reports matching the precoding vector embedded in the propagation channel as defined in subclause B.2.6.1.

### 9.3.4.1.1 Minimum Requirement - UE HS-DSCH categories 15-20

For the parameters specified in Table 9.46, and using the downlink physical channels specified in table C.9, the requirements are specified in terms of maximum BLERs at particular reported CQIs when transmitting a fixed transport format given by the CQI median as shown in Table 9.47. The CQI median shall be determined over all single transport block Type A CQI reports and all Type B CQI reports that were reported together with PCI reports matching the precoding vector embedded in the propagation channel as defined in subclause B.2.6.1. The BLER at a particular reported CQI is obtained by associating a particular CQI reference measurement period for all single transport block Type A CQI reports and all Type B CQI reports that were reported together with PCI reports matching the precoding vector embedded in the propagation channel as defined in subclause B.2.6.1. The BLER at a particular cQI reports and all Type B CQI reports that were reported together with PCI reports matching the precoding vector embedded in the propagation channel as defined in subclause B.2.6.1 with the HS-PDSCH subframe overlapping with the end of this CQI reference measurement period and calculating the fraction of erroneous HS-PDSCH subframes to which the same CQI value was associated.

### 9.3.4.1.2 Additional Requirement – UE HS-DSCH categories 25-28

With both a serving HS-DSCH cell and a secondary serving HS-DSCH cell configured, using the parameters specified in Table 9.47A, and using the downlink physical channels specified in table C.9, the requirements are specified in terms of maximum BLERs at particular reported CQIs when transmitting a fixed transport format given by the cell-specific CQI median as shown in Table 9.47B. The requirement is applicable for each cell individually, that is the median

173

reported CQI, as well as corresponding BLERs, are to be separately determined for each cell and independently verified against the requirement in Table 9.47B. The cell-specific CQI median shall be determined over all single transport block Type A CQI reports and all Type B CQI reports that were reported together with PCI reports matching the precoding vector embedded in the propagation channel as defined in subclause B.2.6.1. The cell-specific BLER at a particular reported CQI is obtained by associating a particular CQI reference measurement period for all single transport block Type A CQI reports and all Type B CQI reports that were reported together with PCI reports matching the cell-specific precoding vector embedded in the propagation channel as defined in subclause B.2.6.1. With the HS-PDSCH subframe overlapping with the end of this CQI reference measurement period and calculating the fraction of erroneous HS-PDSCH subframes to which the same CQI value was associated.

Table 9.47B: Minimum requirement for CQI test in MIMO single stream conditions

### 9.3.4.2 MIMO Dual Stream Fading Conditions

The minimum performance requirements of channel quality indicator (CQI) reporting under MIMO dual stream conditions are defined based on a Type A reporting fraction of 100%, i.e. the parameters  $N_{cqi_typeA}$  and  $M_{cqi}$  (see [8]) are assumed to be both set to 1. The propagation conditions assumed for minimum performance requirements of CQI reporting under MIMO dual stream conditions are defined in subclause B.2.6.2. The precoding used at the transmitter is one randomly picked but fixed precoding matrix for dual transport block transmission out of the set of possible precoding matrices as defined in [8]. The same precoding matrix shall be used to generate the resulting channel coefficients as described for MIMO dual stream conditions in subclause B.2.6.2.

The reporting accuracy of CQI under MIMO dual stream conditions is determined by the BLER performance of two streams of transport blocks using the transport formats indicated by the respective stream specific reported CQI median over all dual transport block CQI reports for each stream that were reported together with PCI reports matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2.

### 9.3.4.2.1 Minimum Requirement – UE HS-DSCH categories 15-20

For the parameters specified in Table 9.48, and using the downlink physical channels specified in table C.9, the requirements are specified in terms of maximum BLERs at particular reported CQIs for each stream when transmitting a fixed transport format per stream given by the stream specific CQI median as shown in Table 9.49. The stream specific CQI median shall be determined over all dual transport block CQI reports that were reported together with PCI reports matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2. When the reported preferred primary precoding vector is matching with the first column of the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2, the reported values CQI₁ and CQI₂ shall be used respectively to determine the median CQI values for stream #1 and stream #2 as depicted in Figure B.5 in subclause B.2.6.2. When the reported preferred primary precoding vector is matching with the second column of the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2, the reported values  $CQI_1$  and  $CQI_2$  shall be used to determine the median COI values for stream #2 and stream #1, respectively. The stream specific BLER at a particular reported COI is obtained by associating a particular COI reference measurement period for all dual transport block COI reports that were reported together with a PCI report that was matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2 with the two transport blocks of the HS-PDSCH subframe overlapping with the end of this CQI reference measurement period and calculating the fractions of erroneous HS-PDSCH subframes to which the same CQI values were associated.

Parameter	Unit	Test 1

### 9.3.4.2.3 Additional Requirement – UE HS-DSCH categories 25-28

With both a serving HS-DSCH cell and a secondary serving HS-DSCH cell configured, using the parameters specified in Table 9.49BA, and using the downlink physical channels specified in table C.9, the requirements are specified in terms of maximum BLERs at particular reported CQIs for each stream when transmitting a fixed transport format per stream given by the stream specific CQI median as shown in Table 9.49BB. The requirement is applicable for each cell and stream individually, that is the median reported CQI, as well as corresponding BLERs, are to be separately determined for each cell and stream, and independently verified against the requirement in Table 9.49BB. The stream and cell-specific CQI median shall be determined over all dual transport block CQI reports that were reported together with PCI reports matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2. When the reported preferred primary precoding vector is matching with the first column of the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2, the reported values  $CQI_1$  and  $CQI_2$  shall be used respectively to determine the median CQI values for stream #1 and stream #2 as depicted in Figure B.5 in subclause B.2.6.2. When the reported preferred primary precoding vector is matching with the second column of the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2, the reported values  $CQI_1$  and  $CQI_2$  shall be used to determine the median CQI values for stream #2 and stream #1, respectively. The stream and cell-specific BLER at a particular reported CQI is obtained by associating a particular CQI reference measurement period for all dual transport block CQI reports that were reported together with a PCI report that was matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2 with the two transport blocks of the HS-PDSCH subframe overlapping with the end of this COI reference measurement period and calculating the fractions of erroneous HS-PDSCH subframes to which the same CQI values were associated.

## 9.3.4.2.4 Additional Requirement – UE HS-DSCH categories 27-28

With both a serving HS-DSCH cell and a secondary serving HS-DSCH cell configured, using the parameters specified in Table 9.49BC, and using the downlink physical channels specified in table C.9, the requirements are specified in

179

terms of maximum BLERs at particular reported CQIs for each stream when transmitting a fixed transport format per stream given by the stream specific CQI median as shown in Table 9.49BD. The requirement is applicable for each cell and stream individually, that is the median reported CQI, as well as corresponding BLERs, are to be separately determined for each cell and stream, and independently verified against the requirement in Table 9.49BB. The stream and cell-specific CQI median shall be determined over all dual transport block CQI reports that were reported together with PCI reports matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2. When the reported preferred primary precoding vector is matching with the first column of the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2, the reported values  $CQI_1$  and  $CQI_2$  shall be used respectively to determine the median CQI values for stream #1 and stream #2 as depicted in Figure B.5 in subclause B.2.6.2. When the reported preferred primary precoding vector is matching with the second column of the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2, the reported values  $CQI_1$  and  $CQI_2$  shall be used to determine the median CQI values for stream #2 and stream #1, respectively. The stream and cell-specific BLER at a particular reported CQI is obtained by associating a particular CQI reference measurement period for all dual transport block CQI reports that were reported together with a PCI report that was matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2 with the two transport blocks of the HS-PDSCH subframe overlapping with the end of this CQI reference measurement period and calculating the fractions of erroneous HS-PDSCH subframes to which the same CQI values were associated.

CQI median + 2	15%		

### 9.3.4.3 MIMO Dual Stream Static Orthogonal Conditions

The minimum performance requirements of channel quality indicator (CQI) reporting under MIMO dual stream conditions are defined based on a Type A reporting fraction of 100%, i.e. the parameters  $N_{cqi_typeA}$  and  $M_{cqi}$  (see

181

[8]) are assumed to be both set to 1. The propagation conditions assumed for minimum performance requirements of CQI reporting under MIMO dual stream static orthogonal conditions are defined in subclause B.2.6.3.

The precoding matrix used in the transmitter shall be one randomly picked but fixed precoding matrix  $\mathbf{W}$  out of the set defined in equation EQ.B.2.6.2.

#### 9.3.4.3.1 Minimum Requirement –UE HS-DSCH categories 15-20

For the parameters specified in Table 9.49C, and using the downlink physical channels specified in table C.9,

the reported CQI value, for each of the streams, shall be in the range of +/-2 of the reported stream specific CQI median more than 90% of the time. The stream specific CQI median shall be determined over all dual transport block CQI reports.

For each of the streams, if the HS-PDSCH BLER using the transport format indicated by the stream specific CQI median is less than or equal to 0.1, the BLER using the transport format indicated by the (stream specific CQI median + 2) shall be greater than 0.1. For each of the streams, if the HS-PDSCH BLER using the transport format indicated by the stream specific CQI median is greater than 0.1, the BLER using transport format indicated by (stream specific CQI median -1) shall be less than or equal to 0.1.

#### Table 9.49C: Test Parameters for CQI test in MIMO dual stream static orthogonal conditions

### Table 9.49EF: Test Parameters for CQI test in MIMO dual stream static orthogonal conditions

### 9.3.5 MIMO only with single-stream restriction Performance

#### 9.3.5.1 MIMO only with single-stream restriction Fading Conditions

The propagation conditions assumed for minimum performance requirements of CQI reporting under MIMO single stream conditions are defined in subclause B.2.6.1. The precoding used at the transmitter is one randomly picked but fixed precoding vector for single transport block transmission out of the set of possible precoding vectors as defined in [8]. The same precoding vector shall be used to generate the resulting channel coefficients as described for MIMO single stream conditions in subclause B.2.6.1.

The reporting accuracy of CQI under MIMO with single-stream restriction is determined by the BLER performance when transmitting with a transport format indicated by the reported CQI median determined over all CQI reports that were reported together with PCI reports matching the precoding vector embedded in the propagation channel as defined in subclause B.2.6.1.

#### 9.3.5.1.1 Minimum Requirement

For the parameters specified in Table 9.49E1, and using the downlink physical channels specified in table C.9, the requirements are specified in terms of maximum BLERs at particular reported CQIs when transmitting a fixed transport format given by the CQI median as shown in Table 9.4E2. The CQI median shall be determined over all CQI reports that were reported together with PCI reports matching the precoding vector embedded in the propagation channel as

185

defined in subclause B.2.6.1. The BLER at a particular reported CQI is obtained by associating a particular CQI reference measurement period for all Type B CQI reports that were reported together with PCI reports matching the precoding vector embedded in the propagation channel as defined in subclause B.2.6.1 with the HS-PDSCH subframe overlapping with the end of this CQI reference measurement period and calculating the fraction of erroneous HS-PDSCH subframes to which the same CQI value was associated.

## 9.4 HS-SCCH Detection Performance

The detection performance of the HS-SCCH is determined by the probability of event  $E_{\rm m}$ , which is declared when the UE is signaled on HS-SCCH-1, but DTX is observed in the corresponding HS-DPCCH ACK/NACK field. The probability of event  $E_{\rm m}$  is denoted  $P(E_{\rm m})$ .

### 9.4.1 HS-SCCH Type 1 Single Link Performance

For the test parameters specified in Table 9.50, for each value of HS-SCCH-1  $E_c/I_{or}$  specified in Table 9.51 and Table 9.51A the measured  $P(E_m)$  shall be less than or equal to the corresponding specified value of  $P(E_m)$ . Enhanced performance requirements type 1 specified in Table 9.51A are based on receiver diversity.

### 9.4.3 HS-SCCH Type 3 Performance

For the test parameters specified in Table 9.55 with the downlink physical channel setup in Table C.12, for each value of HS-SCCH-1  $E_c/I_{or}$  specified in Table 9.56 and Table 9.57 the measured  $P(E_m)$  shall be less than or equal to the corresponding specified value of  $P(E_m)$ . The requirements in Table 9.56 and Table 9.57 assume STTD is enabled on HS-SCCH and DPCH. The requirements in Table 9.56 assume HS-SCCH Type 3 coding associated with single stream transmission on HS-DSCH. The requirements in Table 9.57 assume HS-SCCH Type 3 coding associated with dual stream transmission on HS-DSCH.

For the test parameters specified in Table 9.55 with the downlink physical channel setup in Table C.12E, for each value of HS-SCCH-1  $E_c/I_{or}$  specified in Table 9.57a, Table 9.57b, Table 9.57c and Table 9.57d, the measured  $P(E_m)$  shall be less than or equal to the corresponding specified value of  $P(E_m)$ . The requirements in Table 9.57a and Table 9.57b assume STTD is disabled on HS-SCCH and DPCH. The requirements in Table 9.57c and Table 9.57d assume STTD is enabled on HS-SCCH and DPCH. The requirements in Table 9.57c assume HS-SCCH Type 3 coding associated with single stream transmission on HS-DSCH. The requirements in Table 9.57b and Table 9.57d assume HS-SCCH Type 3 coding associated with dual stream transmission on HS-DSCH.

Minimum performance requirements specified in Table 9.56, 9.57, 9.57a, 9.57b, 9.57c and 9.57d are based on receiver diversity.

# 9.4.4 HS-SCCH Type 3 Performance for MIMO only with single-stream restriction

For the test parameters specified in Table 9.57A1 with the downlink physical channel setup in Table C.12, for each value of HS-SCCH-1  $E_c/I_{or}$  specified in Table 9.57A2 and Table 9.57A3 the measured  $P(E_m)$  shall be less than or equal to the corresponding specified value of  $P(E_m)$ . The requirements in Table 9.57A2 and Table 9.57A3 assume STTD is enabled on HS-SCCH and DPCH. The requirements in Table 9.57A2 and Table 9.57A3 assume HS-SCCH Type 3 coding associated with single stream transmission on HS-DSCH. Performance requirements specified in Table 9.57A3 are based on receiver diversity.

For the test parameters specified in Table 9.57A1 with the downlink physical channel setup in Table C.12E, for each value of HS-SCCH-1  $E_c/I_{or}$  specified in Table 9.57A4, Table 9.57A5, Table 9.57A6 and Table 9.57A7, the measured  $P(E_m)$  shall be less than or equal to the corresponding specified value of  $P(E_m)$ . The requirements in Table 9.57A4 and Table 9.57A5 assume STTD is disabled on HS-SCCH and DPCH. The requirements in Table 9.57A6 and Table 9.57A7 assume STTD is enabled on HS-SCCH and DPCH. The requirements in Table 9.57A5, Table 9.57A6 and Table 9.57A6 and Table 9.57A6 and Table 9.57A7 assume HS-SCCH Type 3 coding associated with single stream transmission on HS-DSCH. Performance requirements specified in Table 9.57A5 and Table 9.57A7 are based on receiver diversity.

# 9.5 HS-SCCH-less demodulation of HS-DSCH (Fixed Reference Channel)

The receiver performance of the High Speed Physical Downlink Shared Channel (HS-DSCH) with HS-SCCH-less operation in multi-path fading environment is determined by the information bit throughput R.

The propagation conditions for this subclause are defined in table B.1C.

During the Fixed Reference Channel tests the behaviour of the Node-B emulator in response to the ACK/NACK signalling field of the HS-DPCCH is specified in Table 9.1A.

Performance requirements in this section assume sufficient power allocation to HS-SCCH_1, so that the probability of detection failure, when the HS-SCCH-1 uses the identity of the UE under test, is very low.

### 9.5.1 Requirement QPSK, Fixed Reference Channel (FRC) H-Set 7

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels Hset 7 specified in Annex A.7.1.7, with the addition of the parameters in Table 9.58 and the downlink physical channel setup according to table C.8.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.59. Enhanced performance requirements type 1 specified in Table 9.60 are based on receiver diversity.

# 9.6 Requirements for HS-DSCH and HS-SCCH reception in CELL_FACH state

The requirements determined in this section apply for UE being able to receive HS-DSCH and HS-SCCH in CELL_FACH state.

### 9.6.1 HS-DSCH demodulation requirements (Single Link)

The receiver single link performance of the High Speed Physical Downlink Shared Channel (HS-DSCH) is determined by the RLC SDU error rate (RLC SDU ER).

### 9.6.1.1 Requirement QPSK, Fixed Reference Channel (FRC) H-Set 3

The requirements are specified in terms of a minimum RLC SDU error rate (RLC SDU ER) for the DL reference channel H-Set 3 (QPSK version) specified in A.7.1.3, with the addition of the parameters in Table 9.61 and the downlink physical channel setup according to Table C.12A. For the test parameters specified in Table 9.61, for the value of HS-DSCH-1  $E_c/I_{or}$  specified in Table 9.62 the measured RLC SDU ER shall be less than or equal to the corresponding specified value of RLC SDU ER.

Pa	rameter	Unit	Test 1

### 9.6.2 HS-SCCH Detection Performance

The detection performance of the HS-SCCH is determined by RLC SDU error rate (RLC SDU ER).

### 9.6.2.1 HS-SCCH Type 1 Single Link Performance

For the test parameters specified in Table 9.63, for the value of HS-SCCH-1  $E_c/I_{or}$  specified in Table 9.64 the measured RLC SDU ER shall be less than or equal to the corresponding specified value of RLC SDU ER. The downlink physical channel setup according to Table C.12B.

## 10 Performance requirement (E-DCH)

## 10.1 General

The performance requirements for the UE in this subclause are specified for the propagation conditions specified in Annex B.2.2 and the Downlink Physical channels specified in Annex C.3.2.

Unless otherwise stated the receiver characteristics are specified at the antenna connector of the UE. For UE(s) with an integral antenna only, a reference antenna with a gain of 0 dBi is assumed. UE with an integral antenna may be taken into account by converting these power levels into field strength requirements, assuming a 0 dBi gain antenna. For UEs with more than one receiver antenna connector the fading of the signals and the AWGN signals applied to each receiver antenna connector shall be uncorrelated. The levels of the test signal applied to each of the antenna connectors shall be as defined in the respective sections below. Enhanced performance requirements Type 1 are based on receiver diversity.

## 10.2 Detection of E-DCH HARQ ACK Indicator Channel (E-HICH)

### 10.2.1 Single link performance

The receive characteristics of the E-DCH HARQ ACK Indicator Channel (E-HICH) in different multi-path fading environments are determined by the missed ACK and false ACK values.

### 10.2.1.1 Performance requirement

For the parameters specified in Table 10.1 the average downlink E-HICH  $E_c/I_{or}$  power ratio shall be below the specified value for the missed ACK probabilities in Table 10.2 and 10.3 for minimum performance requirements and Table 10.2A and 10.3A for enhanced performance requirements Type 1. For the parameters specified in Table 10.1 the false ACK probability shall be below the specified value in Table 10.4 and 10.5.

### 10.2.2 Detection in Inter-Cell Handover conditions

The receive characteristics of the E-DCH HARQ ACK Indicator Channel (E-HICH) is determined during an inter-cell soft handover by the missed ACK and false ACK error probabilities. During the soft handover a UE receives signals from different cells. A UE has to be able to detect E-HICH signalling from different cells belonging to different RLS, containing and not containing the Serving E-DCH cell.

### 10.2.2.1 Performance requirement for RLS not containing the Serving E-DCH cell

For the parameters specified in Table 10.6 the average downlink E-HICH  $E_c/I_{or}$  power ratio of cell belonging to RLS not containing the Serving E-DCH cell shall be below the specified value for the missed ACK probabilities in Table 10.7 and 10.8 for minimum performance requirements and Table 10.7A and 10.8A for enhanced performance requirements Type 1. For the parameters specified in Table 10.6 the false ACK probability shall be below the specified value in Table 10.9 and 10.10.

## 10.3 Detection of E-DCH Relative Grant Channel (E-RGCH)

### 10.3.1 Single link performance

The receive characteristics of the E-DCH Relative Grant Channel (E-RGCH) in multi-path fading environment is determined by the missed UP/DOWN and missed HOLD.

### 10.3.1.1 Performance requirement

For the parameters specified in Table 10.16 the average downlink E-RGCH  $E_c/I_{or}$  power ratio shall be below the specified value for the missed UP/DOWN probabilities in Table 10.17 and 10.18 for minimum performance requirements and Table 10.17A and 10.18A for enhanced performance requirements Type 1. For the parameters specified in Table 10.16 the missed HOLD probability shall be below the specified value in Table 10.19 and 10.20.

199

### 10.3.2 Detection in Inter-Cell Handover conditions

The receive characteristics of the E-DCH Relative Grant Channel (E-RGCH) is determined during an inter-cell soft handover by the missed UP/DOWN and missed HOLD error probabilities. During the soft handover a UE receives signals from different cells. A UE has to be able to detect E-RGCH signalling from different cells, Serving E-DCH cell and Non-serving E-DCH RL.

### 10.3.2.1 Performance requirement for Non-serving E-DCH RL

For the parameters specified in Table 10.21 the missed HOLD probability shall be below the specified value in Table 10.22. For the parameters specified in Table 10.21 the average downlink E-RGCH  $E_c/I_{or}$  power ratio shall be below the specified value for the missed DOWN probabilities in Table 10.23 for minimum performance requirements and Table 10.23A for enhanced performance requirements Type 1.

	Parameter	Unit	Missed HOLD	Missed DOWN

## 10.4 Demodulation of E-DCH Absolute Grant Channel (E-AGCH)

### 10.4.1 Single link performance

The receive characteristics of the E-DCH Absolute Grant Channel (E-AGCH) in multi-path fading environment is determined by the missed detection probability.

#### 10.4.1.1 Performance requirement

For the parameters specified in Table 10.24 the average downlink E-AGCH  $E_c/I_{or}$  power ratio shall be below the specified value for the missed detection probability in Table 10.25 for minimum performance requirements and Table 10.25A for enhanced performance requirements Type 1.

#### Table 10.24: Test parameters for E-AGCH detection - single link

Parameter	Unit	Missed detection
I _{oc}	dBm/3.84	-60

## 11 Performance requirement (MBMS)

Unless otherwise stated the receiver characteristics are specified at the antenna connector of the UE. For UE(s) with an integral antenna only, a reference antenna with a gain of 0 dBi is assumed. UE with an integral antenna may be taken into account by converting these power levels into field strength requirements, assuming a 0 dBi gain antenna. For UEs with more than one receiver antenna connector the fading of the signals and the AWGN signals applied to each receiver antenna connector shall be uncorrelated. The levels of the test signal applied to each of the antenna connectors shall be as defined in the respective sections below.

## 11.1 Demodulation of MCCH

The receive characteristic of the MCCH is determined by the RLC SDU error rate (RLC SDU ER). The requirement is valid for all RRC states for which the UE has capabilities for MBMS.

### 11.1.1 Minimum requirement

For the parameters specified in Table 11.1 the average downlink S-CCPCH_ $E_c/I_{or}$  power ratio shall be below the specified value for the RLC SDU ER shown in Table 11.2.

Parameter	Unit	
		Test 1
Phase reference	-	P-CPICH
I _{oc}	dBm/3.84 MHz	-60
$\hat{I}_{or}/I_{oc}$	dB	-3
MCCH Data Rate		7.6 kbps
Propagation condition		VA3

#### Table 11.1: Parameters for MCCH detection

#### Table 11.2: Test requirements for MCCH detection

Test Number	S-CCPCH_Ec/lor (dB)	RLC SDU ER	
1	-11.6	0.01	

### 11.1.2 Minimum requirement for MBSFN

Requirement in this subclause is applicable to UEs that are capable of receiving MBSFN with at least two receive antenna connectors.

For the parameters specified in Table 11.1a the average downlink S-CCPCH_ $E_c/I_{or}$  power ratio shall be below the specified value for the RLC SDU ER shown in Table 11.2a.

Parameter	Unit	
		Test 1
Phase reference	-	P-CPICH
I _{oc}	dBm/3.84 MHz	-60
$\hat{I}_{or}/I_{oc}$	dB	12
MCCH Data Rate	kbps	7.6
Propagation condition		MBSFN channel model ( see Appendix B)

Table 11.2a: Test requirements	for MCCH detection
--------------------------------	--------------------

Test Number	S-CCPCH_Ec/lor (dB)	RLC SDU ER	
1	-24.9	0.01	

## 11.2 Demodulation of MTCH

The receive characteristic of the MTCH is determined by RLC SDU error rate (RLC SDU ER). RLC SDU ER is specified for each individual data rate of the MTCH. The requirement is valid for all RRC states for which the UE has capabilities for MBMS.

### 11.2.1 Minimum requirement

For the parameters specified in Table 11.3 the average downlink S-CCPCH_ $E_c$  /I_{or} power ratio shall be below the specified value for the RLC SDU ER shown in Table 11.4. If the UE supports optional enhanced performance requirements type1 for MBMS then for the parameters specified in Table 11.3 the average downlink S-CCPCH_ $E_c$  /I_{or} power ratio shall be below the specified value for the RLC SDU ER shown in Table 11.4.

Parameter	Unit	Test 1	Test 2	Test 3
Phase reference	-	P-CPICH		
I _{oc}	dBm/3.84 MHz	-60		
$\hat{I}_{or}/I_{oc}$	dB	-3	-3	-3
MTCH Data Rate		128 kbps	256 kbps	128 kbps

Test Number	S-CCPCH_Ec/lor (dB)	RLC SDU ER
1	-7.7	0.1
2	-8.7	0.1
3	-11.5	0.1

### 11.2.2 Minimum requirement for MBSFN

Requirement in this subclause is applicable to UEs that are capable of receiving MBSFN with at least two receive antenna connectors.

For the parameters specified in Table 11.3a the average downlink S-CCPCH_ $E_c/I_{or}$  power ratio shall be below the specified value for the RLC SDU ER shown in Table 11.4a.

Parameter	Unit	Test 1
Phase reference	-	P-CPICH
I _{oc}	dBm/3.84 MHz	-60
$\hat{I}_{or}/I_{oc}$	dB	12
MTCH Data Rate	kbps	512
Transmission Time Interval	ms	40
Propagation condition		MBSFN channel model (see Appendix B)

Test Number	S-CCPCH_Ec/lor (dB)	RLC SDU ER
1	-5.8	0.1

#### Table 11.4a: Test requirements for MTCH detection

## 11.3 Demodulation of MTCH and cell identification

MBMS combining is not controlled by a network but instead it is autonomously handled by a terminal. UE has to be able to receive MTCH and identify intra-frequency neighbour cells according to the requirements. The receive characteristic of the MTCH combined with cell identification is determined by RLC SDU error rate (RLC SDU ER).

### 11.3.1 Minimum requirement

For the parameters specified in Table 11.5 the average downlink S-CCPCH_ $E_c/I_{or}$  power ratio shall be below the specified value for the RLC SDU error rate shown in Table 11.6. The cell reselection parameters are given in clause A.9 in Table A.34. The different cells are assumed to be time aligned.

Parameter	Unit	Test 1		
Parameter	Unit	Stage 1	Stage 2	Stage 2
Time in each stage	S	2	0.8	3
Phase reference	-	P-CPICH		
I _{oc}	dBm/3.84 MHz	-70	-73	-70

## Annex A (normative): Measurement channels

## A.1 General

The measurement channels in this annex are defined to derive the requirements in clauses 6, 7 and 8. The measurement channels represent example configuration of radio access bearers for different data rates.

The measurement channel for 12.2 kbps shall be supported by any UE both in up- and downlink. Support for other measurement channels is depending on the UE Radio Access capabilities.

## A.2 UL reference measurement channel

## A.2.1 UL reference measurement channel (12.2 kbps)

The parameters for the 12.2 kbps UL reference measurement channel are specified in Table A.1 and Table A.2. The channel coding for information is shown in figure A.1.

#### Table A.1: UL reference measurement channel physical parameters (12.2 kbps)

Parameter	Unit	Level		
Information bit rate	kbps	12.2

# A.4A Reference parameters for discontinuous UL DPCCH transmission

The parameters for the UE UL power control operation with discontinuous UL DPCCH transmission test is specified in Table A.20A. Same parameter values are used for 2ms and 10ms E-DCH TTI.Table A.20A: Parameters for the discontinuous UL DPCCH transmission

Parameter	Unit	Level	
Enabling_Delay	Radio frames	0	
UE_DTX_cycle_1	Subframes	10	Table A.20B:
UE_DTX_cycle_2	Subframes	10	(void)
UE_DTX_DRX_offset	Subframes	0	
Inactivity_threshold_for_UE_DTX_cycle2	E-DCH TTI	1	Figure
UE_DPCCH_burst_1	Subframes	1	A.11A (void)
UE_DPCCH_burst_2	Subframes	1	
UE_DTX_long_preamble_length	Slots	2	
CQI Feedback cycle, k	Milliseconds	0	
CQI_DTX_TIMER	Subframes	0	

# A.5 DL reference compressed mode parameters

Parameters described in Table A.21 are used in some test specified in TS 25.101 while parameters described in Table A.22 and Table A.22A are used in some tests specified in TS 25.133.

Parameters in Table A.21 are applicable when compressed mode by spreading factor reduction is used in downlink.

Parameter	Set 1	Set 2	Note
TGSN (Transmission Gap Starting Slot Number)	11	4	
TGL1 (Transmission Gap Length 1)	7	7	
TGL2 (Transmission Gap Length 2)	-	7	Only one gap in use.
TGD (Transmission Gap Distance)	0	15	Only one gap in use.
TGPL1 (Transmission Gap Pattern Length)	4	4	
TGPRC (Transmission Gap Pattern Repetition	NA	NA	Defined by higher layers
Count)			
TGCFN (Transmission Gap Connection Frame	NA	0	Defined by higher layers

# A.6 DL reference parameters for PCH tests

The parameters for the PCH demodulation tests are specified in Table A.23 and Table A.24.

#### Table A.23: Physical channel parameters for S-CCPCH

Parameter	Unit	Level
Channel bit rate	kbps	60
Channel symbol rate	ksps	30
Slot Format #i	-	4
TFCI	-	OFF
Power offsets of TFCI and Pilot	dB	0
fields relative to data field		

#### Table A.24: Transport channel parameters for S-CCPCH

Parameter	PCH
Transport Channel Number	1
Transport Block Size	240
Transport Block Set Size	240
Transmission Time Interval	10 ms
Type of Error Protection	Convolution Coding
Coding Rate	1/2
Rate Matching attribute	256
Size of CRC	16
Position of TrCH in radio frame	fixed

# A.7 DL reference channel parameters for HSDPA tests

- A.7.1 Fixed Reference Channel (FRC)
- A.7.1.1 Fixed Reference Channel Definition H-Set 1/1A

Parameter	Unit	Va	lue		
Nominal Avg. Inf. Bit Rate	kbps	534	777		
Inter-TTI Distance	TTI"s	3	3		
Number of HARQ Processes	Proces	2	2		
	ses	2	2		
Information Bit Payload ( $N_{\rm INF}$ )	Bits	3202	4664		
Number Code Blocks	Blocks	1	1		
Binary Channel Bits Per TTI	Bits	4800	7680		
Total Available SML"s in UE	SML"s	19200	19200		
Number of SML"s per HARQ Proc.	SML"s	9600	9600		
Coding Rate		0.67	0.61		
Number of Physical Channel Codes	Codes	5	4		
Modulation		QPSK	16QAM		
Note: The HS-DSCH shall be transmitte	d continuo	usly with c	onstant		
power but only every third TTI sha	all be alloca	ted to the	UE		
under test. The values in the table defines H-Set 1. H-Set 1A for					
DC-HSDPA and DB-DC-HSDPA is formed by applying H-Set 1					
to each of the carriers available in DC-HSDPA and DB-DC-					
HSDPA mode.

#### Table A.34: Cell reselection parameters

# Annex B (normative) : Propagation conditions

# B.1 (void)

# B.2 Propagation Conditions

### B.2.1 Static propagation condition

The propagation for the static performance measurement is an Additive White Gaussian Noise (AWGN) environment. No fading and multi-paths exist for this propagation model.

### B.2.2 Multi-path fading propagation conditions

Table B1 shows propagation conditions that are used for the performance measurements in multi-path fading environment. All taps have classical Doppler spectrum.

NOTE 2: Speed above 250km/h is applicable to demodulation performance requirements only.

#### Table B.1A (void)

Table B.1B shows propagation conditions that are used for HSDPA performance measurements in multi-path fading environment. For HSDPA and DCH enhanced performance requirements, the fading of the signals and the AWGN signals provided in each receiver antenna port shall be independent. For DC-HSDPA requirements, the fading of the signals for each cell shall be independent.

# Table B.1E: Propagation Conditions for Multi-Path Fading Environments for MBSFN Demodulation Performance Requirements

# B.2.3 Moving propagation conditions

The dynamic propagation conditions for the test of the baseband performance are non fading channel models with two taps. The moving propagation condition has two tap, one static, Path0, and one moving, Path1. The time difference between the two paths is according Equation (B.1). The taps have equal strengths and equal phases.

Figure B.1: The moving propagation conditions

$$\Delta \tau = B + \frac{A}{2} \left( 1 + \sin(\Delta \omega \cdot t) \right) \tag{B.1}$$

The parameters in the equation are shown in the following table.

#### Table B.2

Parameter	Value
A	5 μs
В	1 μs
Δω	40*10 ⁻³ s ⁻¹

### B.2.4 Birth-Death propagation conditions

The dynamic propagation conditions for the test of the base band performance is a non fading propagation channel with two taps. The moving propagation condition has two taps, Path1 and Path2 which alternate between "birth" and "death". The positions the paths appear are randomly selected with an equal probability rate and is shown in Figure B.2.

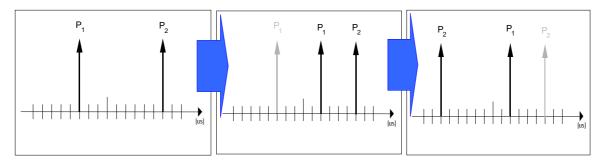

Figure B.2: Birth death propagation sequence

- 1. Two paths, Path1 and Path2 are randomly selected from the group[-5,-4,-3,-2,-1,0,1,2,3,4,5] μs. The paths have equal magnitudes and equal phases.
- 2. After 191 ms, Path1 vanishes and reappears immediately at a new location randomly selected from the group [-5,-4,-3,-2,-1,0,1,2,3,4,5] μs but excludes the point Path 2. The magnitudes and the phases of the tap coefficients of Path 1 and Path 2 shall remain unaltered.
- 3. After an additional 191 ms, Path2 vanishes and reappears immediately at a new location randomly selected from the group [-5,-4,-3,-2,-1,0,1,2,3,4,5] μs but excludes the point Path 1. The magnitudes and the phases of the tap coefficients of Path 1 and Path 2 shall remain unaltered.

The sequence in 2) and 3) is repeated.

## B.2.5 High speed train condition

The high speed train condition for the test of the baseband performance is a non fading propagation channel with one tap. Doppler shift is given by

$$f_s(t) = f_d \cos \theta(t) \tag{B.2}$$

where  $f_s(t)$  is the Doppler shift and  $f_d$  is the maximum Doppler frequency. The cosine of angle  $\theta(t)$  is given by

$$\cos\theta(t) = \frac{D_s/2 - vt}{\sqrt{D_{\min}^2 + (D_s/2 - vt)^2}}, \ 0 \le t \le D_s/v$$
(B.3)

$$\cos\theta(t) = \frac{-1.5D_s + vt}{\sqrt{D_{\min}^2 + (-1.5D_s + vt)^2}}, \ D_s/v < t \le 2D_s/v$$
(B.4)

$$\cos\theta(t) = \cos\theta(t \mod (2D_s/v)), \ t > 2D_s/v \tag{B.5}$$

where  $D_s/2$  is the initial distance of the train from BS, and  $D_{\min}$  is BS-Railway track distance, both in meters; v is the velocity of the train in m/s, t is time in seconds.

Doppler shift and cosine angle is given by equation B.2 and B.3-B.5 respectively, where the required input parameters listed in table B.3 and the resulting Doppler shift shown in Figure B.3 are applied for all frequency bands.

Parameter	Value
$D_s$	300 m
$D_{\min}$	2 m
V	300 km/h
$f_d$	600 Hz

Table B.3

NOTE1: Parameters for HST conditions in table B.3 including  $f_d$  and Doppler shift trajectories presented on figure B.3 were derived for Band1.

Figure B.3: Doppler shift trajectory

### B.2.6 MIMO propagation conditions

MIMO propagation conditions are defined for a 2x2 antenna configuration. The resulting propagation channel shall be characterized by a complex 2x2 matrix termed

$$\mathbf{H} = \begin{pmatrix} h_{11} & h_{12} \\ h_{21} & h_{22} \end{pmatrix}.$$

The channel coefficients of  $\mathbf{H}$  shall be defined as a function of the possible precoding vectors or matrices. The possible precoding vectors for MIMO operation according to [8] shall be termed

$$\mathbf{w}^{(1)} = \begin{pmatrix} \frac{1}{\sqrt{2}} \\ \frac{1+j}{2} \end{pmatrix}, \quad \mathbf{w}^{(2)} = \begin{pmatrix} \frac{1}{\sqrt{2}} \\ \frac{1-j}{2} \end{pmatrix}, \quad \mathbf{w}^{(3)} = \begin{pmatrix} \frac{1}{\sqrt{2}} \\ \frac{-1+j}{2} \end{pmatrix}, \quad \mathbf{w}^{(4)} = \begin{pmatrix} \frac{1}{\sqrt{2}} \\ \frac{-1-j}{2} \end{pmatrix}$$
(EQ.B.2.6.1)

In what follows. Furthermore the following possible precoding matrices shall be defined:

$$\mathbf{W}^{(1)} = \begin{pmatrix} \mathbf{w}^{(1)} & \mathbf{w}^{(4)} \end{pmatrix}, \quad \mathbf{W}^{(2)} = \begin{pmatrix} \mathbf{w}^{(2)} & \mathbf{w}^{(3)} \end{pmatrix}, \quad \mathbf{W}^{(3)} = \begin{pmatrix} \mathbf{w}^{(3)} & \mathbf{w}^{(2)} \end{pmatrix}, \quad \mathbf{W}^{(4)} = \begin{pmatrix} \mathbf{w}^{(4)} & \mathbf{w}^{(1)} \end{pmatrix} \quad (EQ.B.2.6.2)$$

#### B.2.6.1 MIMO Single Stream Fading Conditions

For MIMO single stream conditions, the resulting propagation channel shall be generated using two independent fading processes with classical Doppler and one randomly picked but fixed precoding vector  $\mathbf{w}$  out of the set defined in equation EQ.B.2.6.1. The two fading processes shall be generated according to the parameters in Table B.4

#### Table B.4

MIMO Single Stream Conditions, Speed for Band I, II, III, IV, IX and X: 3km/h Speed for Band V, VI, VIII, XIX and XX: 7.1km/h Speed for Band VII: 2.3km/h Speed for Band XI, XXI: 4.1km/h Speed for Band XII, XIII and XIV 8 km/h			
Relative Delay [ns]	(Amplitude, phase) symbols		
0	$(a_1, \varphi_1)$		
0	0	$(a_2^{}, arphi_2)$	

NOTE: The amplitude  $a_2$  is not used in tests under MIMO single stream conditions, only the phase  $\varphi_2$  will be used.

The channel coefficients of the resulting propagation channnel under MIMO single stream condiitons shall be given by

$$\mathbf{H} = \begin{pmatrix} h_{11} & h_{12} \\ h_{21} & h_{22} \end{pmatrix} = a_1 \cdot \begin{pmatrix} \exp(\mathbf{j} \cdot \boldsymbol{\varphi}_1) \\ \exp(-\mathbf{j} \cdot \boldsymbol{\varphi}_2) \end{pmatrix} \cdot \mathbf{w}^{\mathrm{H}}$$

The generation of the resulting channel coefficients for MIMO single stream conditions and the association with the transmitter and receiver ports are depicted Figure B.4. Figure B.4 does not restrict test system implementation.

### B.2.6.2 MIMO Dual Stream Fading Conditions

For MIMO dual stream conditions, the resulting propagation channel shall be generated using two independent fading processes with classical Doppler and one randomly picked but fixed precoding matrix  $\mathbf{W}$  out of the set defined in equation EQ.B.2.6.2. The two fading processes shall be generated according to the parameters in Table B.5

MIMO Dual Stream Conditions,						
Speed for Band I, II, III, IV, IX and X: 3km/h						
	Band V, VI, VIII, XIX a					
	Speed for Band VII: 2.3	km/h

Speed for Band XII, XIII and XIV: 8 km/h						
Relative Delay	(Amplitude, phase)					
[ns]	Power [dB]	symbols				
0	0	$(a_1^{}, arphi_1^{})$				
0	-3	$(a_{_2},arphi_{_2})$				

Table B.5

The channel coefficients of the resulting propagation channel under MIMO dual stream condiitons shall be given by

$$\mathbf{H} = \begin{pmatrix} h_{11} & h_{12} \\ h_{21} & h_{22} \end{pmatrix} = \sqrt{\frac{2}{3}} \begin{pmatrix} \exp(\mathbf{j} \cdot \boldsymbol{\varphi}_1) & \exp(\mathbf{j} \cdot \boldsymbol{\varphi}_2) \\ \exp(-\mathbf{j} \cdot \boldsymbol{\varphi}_2) & -\exp(-\mathbf{j} \cdot \boldsymbol{\varphi}_1) \end{pmatrix} \cdot \begin{pmatrix} a_1 & 0 \\ 0 & a_2 \end{pmatrix} \cdot \mathbf{W}^{\mathrm{H}}$$

The generation of the resulting channel coefficients for MIMO dual stream conditions and the association with the transmitter and receiver ports are depicted Figure B.5. Figure B.5 does not restrict test system implementation.

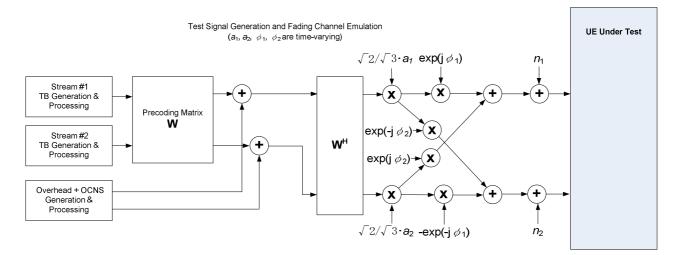

Figure B.5: Test setup under MIMO Dual Stream Fading Conditions

### B.2.6.3 MIMO Dual Stream Static Orthogonal Conditions

The channel coefficients of the resulting propagation channel under MIMO dual stream condiitons shall be given by

$$\mathbf{H} = \begin{pmatrix} h_{11} & h_{12} \\ h_{21} & h_{22} \end{pmatrix} = \begin{pmatrix} 1 & 1 \\ 1 & -1 \end{pmatrix}$$

The generation of the resulting channel coefficients for MIMO dual stream conditions and the association with the transmitter and receiver ports are depicted Figure B.6. Figure B.6 does not restrict test system implementation.

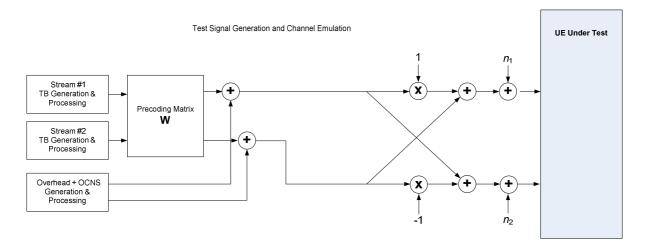

Figure B.6: Test setup under MIMO Dual Stream Static Orthogonal Conditions

# Annex C (normative): Downlink Physical Channels

# C.1 General

This annex specifies the downlink physical channels that are needed for setting a connection and channels that are needed during a connection.

# C.2 Connection Set-up

Table C.1 describes the downlink Physical Channels that are required for connection set up.

Physical Channel	
P-CPICH	
P-CCPCH	
SCH	
S-CCPCH	
PICH	
AICH	
DPCH	

#### Table C.1: Downlink Physical Channels required for connection set-up

# C.3 During connection

The following clauses, describes the downlink Physical Channels that are transmitted during a connection i.e., when measurements are done. For these measurements the offset between DPCH and SCH shall be zero chips at Node B meaning that SCH is overlapping with the first symbols in DPCH in the beginning of DPCH slot structure.

# C.3.1 Measurement of Rx Characteristics

Table C.2 is applicable for measurements on the Receiver Characteristics (clause 7) with the exception of subclause 7.4 (Maximum input level).

Physical Channel Power ratio		
P-CPICH	P-CPICH_Ec / DPCH_Ec = 7 dB	
P-CCPCH	P-CCPCH_Ec / DPCH_Ec = 5 dB	
SCH	SCH_Ec / DPCH_Ec = 5 dB	
PICH	PICH_Ec / DPCH_Ec = 2 dB	
DPCH	Test dependent power	

# C.3.2 Measurement of Performance requirements

Table C.3 is applicable for measurements on the Performance requirements (clause 8), including subclause 7.4 (Maximum input level) and subclause 6.4.4 (Out-of-synchronization handling of output power).

Physical Channel	Power ratio	NOTE
P-CPICH	P-CPICH_Ec/lor = -10 dB	Use of P-CPICH or S-CPICH as phase reference is specified for each requirement and is also set by higher layer signalling.
S-CPICH	S-CPICH_Ec/lor = -10 dB	When S-CPICH is the phase reference in a test condition, the phase of S-CPICH shall be 180 degrees offset from the phase of P-CPICH. When S-CPICH is not the phase reference, it is not transmitted.
P-CCPCH	P-CCPCH_Ec/lor = -12 dB	When BCH performance is tested the P- CCPCH_Ec/lor is test dependent
SCH	SCH_Ec/lor = -12 dB	This power shall be divided equally between Primary and Secondary Synchronous channels
PICH	PICH_Ec/lor = -15 dB	
DPCH	Test dependent power	When S-CPICH is the phase reference in a test condition, the phase of DPCH shall be 180 degrees offset from the phase of P-CPICH. When BCH performance is tested the DPCH is not transmitted.
OCNS	Necessary power so that total transmit power spectral density of Node B (Ior) adds to one ¹	OCNS interference consists of 16 dedicated data channels as specified in table C.6.

Table C.3: Downlink Physical Channels transmitted during a connection¹

NOTE 1 For dynamic power correction required to compensate for the presence of transient channels, e.g. control channels, a subset of the DPCH channels may be used.

# C.3.3 Connection with open-loop transmit diversity mode

Table C.4 is applicable for measurements for subclause 8.6.1 (Demodulation of DCH in open loop transmit diversity mode).

Physical Channel Power ratio		NOTE	
P-CPICH (antenna 1)	P-CPICH_Ec1/lor = -13 dB	1. Total P-CPICH_Ec/lor = -10 dB	
P-CPICH (antenna 2)	P-CPICH_Ec2/lor = -13 dB		
P-CCPCH (antenna 1)	P-CCPCH_Ec1/lor = -15 dB	1. STTD applied	
P-CCPCH (antenna 2)	P-CCPCH_Ec2/lor = -15 dB	<ol><li>Total P-CCPCH_Ec/lor = -12 dB</li></ol>	
SCH (antenna 1 / 2)	SCH_Ec/lor = -12 dB	<ol> <li>TSTD applied.</li> <li>This power shall be divided equally between Primary and Secondary Synchronous channels</li> <li>When BCH performance is tested the P-CCPCH_Ec/lor is test dependent</li> </ol>	
PICH (antenna 1)	PICH_Ec1/lor = -18 dB	1. STTD applied	
PICH (antenna 2)	PICH_Ec2/lor = -18 dB	2. Total PICH_Ec/lor = -15 dB	
DPCH	Test dependent power	<ol> <li>STTD applied</li> <li>Total power from both antennas</li> </ol>	
OCNS	Necessary power so that total transmit power spectral density of Node B (lor) adds to one ¹	<ol> <li>This power shall be divided equally between antennas</li> <li>OCNS interference consists of 16 dedicated data channels as specified in Table C.6.</li> </ol>	

 Table C.4: Downlink Physical Channels transmitted during a connection¹

NOTE 1 For dynamic power correction required to compensate for the presence of transient channels, e.g. control channels, a subset of the DPCH channels may be used.

# C.3.4 Connection with closed loop transmit diversity mode

Table C.5 is applicable for measurements for subclause 8.6.2 (Demodulation of DCH in closed loop transmit diversity mode).

Physical Channel Power ratio		NOTE		
P-CPICH (antenna 1)	P-CPICH_Ec1/lor = -13 dB	1 Total D CDICH Faller 10 dD		
P-CPICH (antenna 2)	P-CPICH_Ec2/lor = -13 dB	1. Total P-CPICH_Ec/lor = -10 dB		
P-CCPCH (antenna 1)	P-CCPCH_Ec1/lor = -15 dB	1. STTD applied		
P-CCPCH (antenna 2)	P-CCPCH_Ec2/lor = -15 dB	<ol> <li>STTD applied,</li> <li>total P-CCPCH_Ec/lor = -12 dB</li> </ol>		
SCH (antenna 1 / 2)	SCH_Ec/lor = -12 dB	1. TSTD applied		
PICH (antenna 1)	$PICH_Ec1/lor = -18 dB$	1. STTD applied		
PICH (antenna 2)	PICH_Ec2/lor = -18 dB	2. STTD applied, total PICH_Ec/lor = -15 dB		
DPCH	Test dependent power	1. Total power from both antennas		
OCNS Necessary power so that total transmit power spectral density of Node B (lor) adds to one (Notes 1 & 2)		<ol> <li>This power shall be divided equally between antennas</li> <li>OCNS interference consists of 16 dedicated data channels. As specified in Table C.6.</li> </ol>		
<ul> <li>NOTE 1: For dynamic power correction required to compensate for the presence of transient channels, e.g. control channels, a subset of the DPCH channels may be used.</li> <li>NOTE 2: For the case of DPCH with transmit diversity, the OCNS power calculation shall be based on the addition of the power from Antenna 1 and Antenna 2, i.e. disregarding any phase relationship between the antennas.</li> </ul>				

Table C.5: Downlink Physical	Channels transmitted	during a connection ¹
	onannoio tranonnitioa	aaring a connoction

	nelization at SF=128	Relative Level setting (dB) (Note	DPCH Data (see NOTE 3)	
	0	1)	The DDOLL date (as each shown direction	
	2	-1	The DPCH data for each channelization	
	11	-3	code shall be uncorrelated with each other	
	17	-3	and with any wanted signal over the period	
	23	-5	of any measurement. For OCNS with	
	31	-2	transmit diversity the DPCH data sent to each antenna shall be either STTD encoded	
	38	-4		
	47	-8	or generated from uncorrelated sources.	
	55	-7		
	62	-4

Table C.12E: Downlink physical channels for HSDPA receiver testing for HS-SCCH detection performance with asymmetric P-CPICH/S-CPICH power settings.

#### **OCNS** Definition C.5.2

The selected channelization codes and relative power levels for OCNS transmission during for HSDPA performance assessment for other than enhanced performance type 3i are defined in Table C.13. The selected codes are designed to have a single length-16 parent code. The test definition for the enhanced performance type 3i is defined in section C.5.3.

Table C.13: OCNS def	finition for HSDPA	receiver testing.
----------------------	--------------------	-------------------

Channelization Code at SF=128	Relative Level setting (dB) (Note 1)	DPCH Data
122	0	The DPCH data for each channelization
123	-2	code shall be uncorrelated with each other
124	-2	and with any wanted signal over the period
125	-4	of any measurement. For OCNS with
126	-1	transmit diversity the DPCH data sent to
127	-3	each antenna shall be either STTD encoded or generated from uncorrelated sources.

Channelization Code at SF=128	Relative Level setting (dB) (Note 1)	DPCH Data
4	0	The DPCH data for each channelization code shall be uncorrelated with each other and with any wanted signal over the period of any
5	-2	measurement. For OCNS with transmit diversity the DPCH data sent to each antenna
6	-4	shall be either STTD encoded or generated from uncorrelated sources.
7	-1	

Table C.13A: OCNS definition for HSDPA receiver testing, FRC H-Set 8, H-Set 9, H-Set 10 and H-Set 11.

NOTE 1: The relative level setting specified in dB refers only to the relationship between the OCNS channels. The level of the OCNS channels relative to the Ior of the complete signal is a function of the power of the other channels in the signal with the intention that the power of the group of OCNS channels is used to make the total signal add up to 1.

#### C.5.3 Test Definition for Enhanced Performance Type 3i

This section defines additional test definition for enhanced performance type 3i including: number of interfering cells and their respective powers; transmitted code and power characteristics (OCNS) for serving and interfering cells; and frame offsets for interfering cells. For DC-HSDPA requirements, the number of interfering cells and their respective powers; transmitted code and power characteristics (OCNS) for serving and interfering cells; and frame offsets for interfering cells shall be the same for each carrier frequency. The transmitted OCNS and data signals shall be independent for each cell.

DIPi =  $\hat{I}_{or(i+1)} / I_{oc}$  where  $\hat{I}_{orj}$  is the average received power spectral density from the *j*-th strongest interfering cell ( $\hat{I}_{orl}$  is assumed to be the power spectral density associated with the serving cell), and  $I_{oc}$ " is given by  $I_{oc}$  '=  $\sum_{i=2}^{3} \hat{I}_{orj} + I_{oc}$  where Ioc is the average power spectral density of a band limited white noise source

consistent with the definition provided in section 3.2.

#### C.5.3.1 Transmitted code and power characteristics for serving cell

The downlink physical channel code allocations for the serving cell are specified in Table C.14. Ten HS-PDSCH codes have been reserved for the user of interest, based upon the use of QPSK with FRC H-Set 6. The other user codes are selected from 46 possible SF = 128 codes. Note not all 46 of these codes are used, and in addition only 16 codes are used at a given instance in time. Table C.15 summarizes the power allocations of different channels for the serving cell for 50% and 25% HS-PDSCH power allocation. Note the power allocations in the last row of Table C.15 are to be split between the HS-SCCH and the other users" channels in order to ensure proper operation of the HS-SCCH during testing.

Table C.16 summarizes the channelization codes to be used for the other users channels (OCNS) along with their respective relative power allocations in dB when HS-PDSCH is allocated 25% or 50% of the total power. As shown in Table C.16, there are two groups of 16 codes, which are randomly selected with equal probability on a symbol-by-symbol basis. This random selection is done per code pair, where a code pair occupies the same row, as opposed to selecting all of the codes within group 1 or group 2. This random selection between these two groups is for purposes of modelling a simplified form of DTX. Note that the switching time for the symbols with SF = 64 would be the symbol timing associated with an SF 64 channel, and the switching time for the symbols with SF = 128 would be the symbol timing for SF = 128 channel. Thus, there would be two different symbol times dependent upon the SF. For SF = 64,

symbol time ~ 16.67 microseconds, and for SF = 128, symbol time ~ 33.33 microseconds. Each of these users is also power controlled as described in section C.5.3.3.

The scrambling code of the serving cell is set to 0.

Table C.14. Down	link physical	channel cod	e allocation.

C _{ch,64,60}	C _{ch,64,46}	-1.1
C _{ch,128,125}	C _{ch,128,95}	-4.1

Note: The relative level settings specified in dB refer only to the relationship between the OCNS channels. For the serving cell, the sum of the powers of the OCNS channels plus the power allocated to the HS-SCCH must add up to the values specified in the last row of Table C.15. For the interfering cells, the sum of the powers of the OCNS channels must add up to the value shown in the last row of Table C.17.

261

#### C.5.3.2 Transmitted code and power characteristics for interfering cells

The downlink physical channel code allocations for the interfering cells are same as for the serving cell as given in Table C.14. The modelling approach for the interfering cells is summarized in Table C.17. The modelling of the other users" dedicated channels is done in the same way as in the case of the serving cell except that the HSDPA power allocation is fixed at 50% and the total power allocated is not shared with the HS-SCCH. Thus, the two groups of channelization codes defined in Table C.16 apply, along with the specified relative power levels.

	Interfering cell(s)
Common channels	0.195 (-7.1dB)
	As specified in Table C.8
HS-PDSCH transport	Selected randomly from Table C.18
format	Independent for each interferer.
HS-PDSCH power	0.5
allocation [E _c /I _{or} ]	(-3 dB)
Other users" channels	0.3049
	(-5.16 dB)
	Set according to Table C.16 for 50%
	HS-PDSCH power allocation

Table C.17. Summary of modelling approach for the interfering cells.

Note: The values given in decibel are only for information.

The HS-PDSCH transmission for interfering cells is modelled to have randomly varying modulation and number of codes. The predefined modulation and number of codes are given in Table C.18, with the actual codes selected per the code allocation given in Table C.14. The transmission from each interfering cell is randomly and independently selected every HSDPA TTI among the four options given in Table C.18.

The scrambling codes of the interfering cells are set to 16 and 32, respectively. The frame offsets for the interfering cells are set to 1296 and 2576 chips relative to the serving cell. The scrambling code value of 16 and the frame offset value of 2576 corresponds to the first interfering cell.

Table C.18. Predefined interferer	transmission.
-----------------------------------	---------------

#	Used modulation and number of HS-PDSCH codes
1	QPSK with 5 codes
2	16QAM with 5 codes
3	QPSK with 10 codes
4	16QAM, with 10 codes

#### C.5.3.3 Model for power control sequence generation

In this section the modelling of power control for the other users" channels is described. There are two powers that are calculated for each user, I at each slot, n. The first is an interim power calculation, which develops a power  $P_n^i$  in dB.

The second is the actual applied transmit power,  $\hat{P}_n^i$  in the linear domain, which is normalized such that the total power for all users remains the same as that originally allocated. The interim power calculation is described first followed by the applied, normalized power calculation.

The interim power is varied randomly, either by increasing or decreasing it by 1 dB steps in each slot, i.e.

$$P_n^i = P_{n-1}^i + \Delta$$
, where  $\Delta \in \{-1, +1\}$  (EQ.C.5.3.3.1)

The probability of  $\Delta$  having a value of +1 for the  $i^{th}$  user at time instant n can be determined as

$$Pr_n^i(\Delta = +1) = 0.5 - (P_{n-1}^i - P_0^i)\frac{0.5}{L}$$
 (EQ.C.5.3.3.2)

where,  $P_{n-1}^{i}$  is the interim power at time instant *n*-1 and  $P_{0}^{i}$  is the initial value given in Table C.16 after conversion to dB for each of the two possible HS-PDSCH power allocations. *L* is a scaling factor which can be used to determine the range to which the variation of power is confined. The value of *L* is set to 10, leading to a variance of ~5 dB.

The applied, normalized power is given by

$$\hat{P}_{n}^{i} = \frac{P_{lin,n}^{i}}{\sum_{i} P_{lin,n}^{i}} \sum_{i} P_{lin,0}^{i}$$
(EQ.C.5.3.3.3)

where  $P_{lin,n}^{i}$  is the interim power of the user I at time instant n in the linear domain, and  $P_{lin,0}^{i}$  is the initial value of the ith user"s power also in the linear domain. Each summation is over all 16 possible values for  $P_{lin,n}^{i}$  and  $P_{lin,0}^{i}$  where the latter summation is equal to either 0.5551 or 0.3049 for HS-PDSCH allocations of 25% and 50%, respectively, see Table C.16. The total instantaneous output power of the OCNS is now always equal to its allocated power. One other subtle point to note is that at each iteration of interim power generation using (EQ.C.5.3.3.1) that the value of  $P_{n-1}^{i}$  is set to  $P_{n}^{i}$  of the previous iteration as opposed to  $\hat{P}_{n}^{i}$  of the previous iteration. In summary, two sets of power control

sequences are developed using (EQ.C.5.3.3.1) and (EQ.C.5.3.3.3), respectively, where the interim outputs developed by (C.1) are used to develop the applied, normalized values described by (EQ.C.5.3.3.3) and to which the actual channel powers are set.

### C.6 MBMS DL Physical channels

### C.6.1 Downlink Physical Channels connection set-up

Table C.14 is applicable for measurements on the Performance requirements in Clause 11.

Physical Channel	Power ratio	NOTE
P-CPICH	P-CPICH_Ec/lor = -10 dB	Only P-CPICH is used as phase reference for S-CCPCH carrying MCCH or MTCH.
P-CCPCH	P-CCPCH_Ec/lor = -12 dB	
SCH	SCH_Ec/lor = -12 dB	This power shall be divided equally between Primary and Secondary Synchronous channels
PICH	PICH_Ec/lor = -15 dB	
S-CCPCH	S-CCPCH_Ec/lor = test dependent	
DPCH	TBD	DPCH is enable only when UE has capability to receive MBMS in CELL_DCH state
OCNS	Necessary power so that total transmit power spectral density of Node B (lor) adds to one	OCNS interference consists of 16 dedicated data channels as specified in table C.6.

### C.6.2 Downlink Physical Channels connection set-up for MBSFN

Physical Channel	Power ratio	NOTE
P-CPICH	P-CPICH_Ec/lor = -10 dB	Only P-CPICH is used as phase reference for S-CCPCH carrying MCCH or MTCH.
P-CCPCH	P-CCPCH_Ec/lor = -12 dB	
SCH	SCH_Ec/lor = -12 dB	This power shall be divided equally between Primary and Secondary Synchronous channels
S-CCPCH	S-CCPCH_Ec/lor = test dependent	
OCNS	Necessary power so that total transmit power spectral density of Node B (lor) adds to one	Same code channels as used for DPCH, see table C.6

#### Table C.14a: Downlink Physical Channels for performance requirements

### Annex D (normative) : Environmental conditions

### D.1 General

This normative annex specifies the environmental requirements of the UE. Within these limits the requirements of the present documents shall be fulfilled.

### D.2 Environmental requirements

The requirements in this clause apply to all types of UE(s).

### D.2.1 Temperature

The UE shall fulfil all the requirements in the full temperature range of:

+15°C to +35°C	for normal conditions (with relative humidity of 25 % to 75 %)	
-10 [°] C to +55 [°] C	for extreme conditions (see IEC publications 68-2-1 and 68-2-2)	

Outside this temperature range the UE, if powered on, shall not make ineffective use of the radio frequency spectrum. In no case shall the UE exceed the transmitted levels as defined in TS 25.101 for extreme operation.

### D.2.2 Voltage

The UE shall fulfil all the requirements in the full voltage range, i.e. the voltage range between the extreme voltages.

The manufacturer shall declare the lower and higher extreme voltages and the approximate shutdown voltage. For the equipment that can be operated from one or more of the power sources listed below, the lower extreme voltage shall not be higher, and the higher extreme voltage shall not be lower than that specified below.

Power source	Lower extreme voltage	Higher extreme voltage	Normal conditions voltage
AC mains	0,9 * nominal	1,1 * nominal	nominal
Regulated lead acid battery	0,9 * nominal	1,3 * nominal	1,1 * nominal
Non regulated batteries:			
Leclanché	0,85 * nominal	Nominal	Nominal
Lithium	0.95 * nominal	1,1 * nominal	1,1 * nominal
Mercury/nickel & cadmium	0,90 * nominal	Nominal	Nominal

#### Table D.2

Outside this voltage range the UE if powered on, shall not make ineffective use of the radio frequency spectrum. In no case shall the UE exceed the transmitted levels as defined in TS 25.101 for extreme operation. In particular, the UE shall inhibit all RF transmissions when the power supply voltage is below the manufacturer declared shutdown voltage.

### D.2.3 Vibration

The UE shall fulfil all the requirements when vibrated at the following frequency/amplitudes.

Frequency	ASD (Acceleration Spectral Density) random vibration
5 Hz to 20 Hz	0,96 m ² /s ³
20 Hz to 500 Hz	0,96 m ² /s ³ at 20 Hz, thereafter -3 dB/Octave

#### Table D.3

Outside the specified frequency range the UE, if powered on, shall not make ineffective use of the radio frequency spectrum. In no case shall the UE exceed the transmitted levels as defined in TS 25.101 for extreme operation

# Annex E (informative): UARFCN numbers

### E.1 General

This Annex lists the UARFCN numbers used for the frequency bands implemented in the current specification.

### E.2 List of UARFCN used for UTRA FDD bands

The UARFCN numbering scheme detailed in clauses 5.4.3 and 5.4.4 of this specification is summarized for information in Table E.1. The table shows the UARFCN assigned to all UTRA FDD operating bands, starting with the lowest UARFCN and continuing up to the highest one assigned.

Each band may have two table entries, one for the 'general' numbers and one for the 'additional' ones, as specified in Table 5.2. The entries in Table E.1 are explained as follows:

Band range: The size of the frequency range for the UTRA FDD band specified in Table 5.0.

**Range res.:** The size of the frequency range corresponding to the UARFCN range that has been 'reserved' in 3GPP for possible future extensions of the band.

**Formula offset:** The offset parameter ( $F_{UL_Offset}$  or  $F_{DL_Offset}$ ) in the formula, used to calculate the UARFCN as specified in Clause 5.4.3.

Assigned/reserved: Indicates the significance of the UARFCN and corresponding frequencies listed as follows:

**Start res**. Start of the UARFCN range reserved for the band.

- Min. The lowest UARFCN assigned to the band.
- Max. The highest UARFCN assigned to the band.

**End res.** End of the UARFCN range reserved for the band.

N_U, N_D: Uplink and downlink UARFCN.

F_{UL}, F_{DL}: Corresponding uplink and downlink frequencies.

(Add.): Refers to the additional UARFCN (on the 100 kHz raster) as specified in Table 5.1A.

Note that bands V and VI are shown with common entries in Table E.1, since their UARFCN ranges are completely overlapping.

RP-37				Rel-7 version created based on v7.9.0			8.0.0	
RP-37	RP-070658	0567		Introduction of UMTS1500 requirements (Rel-8)	В	7.9.0	8.0.0	RinImp8- UMTS1500
RP-37	RP-070654	0571	1	MBSFN FDD UE dem req	В	7.9.0	8.0.0	MBMSE- RANPhysFD D
RP-38	RP-070934	0578		Correction to UE Relative code domain power accuracy	A	8.0.0	8.1.0	RANimp- 16QamUplin k
RP-38	RP-070934		1	Introduction of requirements for UE capable of receiving HS-DSCH and HS-SCCH in CELL_FACH state	A	8.0.0	8.1.0	RANImp- Enhstate
RP-38	RP-070936			Editorial correction to the RV sequence of the MIMO FRC	A	8.0.0	8.1.0	MIMO-RF
RP-38	RP-070937	0575		Correction to extreme condition voltages for Lithium batteries in table D.2.2	A	8.0.0	8.1.0	TEI7
RP-39	RP-080121	0593		Correct reference to MIMO dual-stream channel model for MIMO CQI dual-stream requirements	A	8.1.0	8.2.0	MIMO-RF
RP-39	RP-080121			HS-SCCH Type nominator	Α	8.1.0	8.2.0	MIMO-RF
RP-39	RP-080121	0592	1	Nominal Peak Data Rate and redundancy versions in MIMO FRC Tests	A	8.1.0	8.2.0	MIMO-RF
RP-39	RP-080124	0583	2	Introduction of UMTS700EMC requirements	В	8.1.0	8.2.0	RinImp8- UMTS700
RP-39	RP-080165	0598		Addition of 15 code HSDPA demodulation requirements for 16QAM and QPSK	В	8.1.0	8.2.0	RinImp8- Hsdpa15cod es
RP-39	RP-080166	0582	1	Specification of enhanced performance requirements type 3i for HSDPA based on receiver diversity and interference-aware chip level equaliser	В	8.1.0	8.2.0	RinImp8- 2BIC
RP-39	RP-080167	0595		Correct reference to H-Set for 64-QAM max input test	A	8.1.0	8.2.0	RinImp
RP-40	RP-080326	0606		Correction of UMTS700 UE blocking and intermodulation values	F	8.2.0	8.3.0	RinImp8- UMTS700
RP-40	RP-080328	0608	2	Introduction of Cat 19-20 demodulation requirement and cleanup of HS-DSCH requirement applicability.	В	8.2.0	8.3.0	RANimp- 64QamMim oHsdpa
RP-40	RP-080323			Correction to MIMO propagation conditions	Α	8.2.0	8.3.0	MIMO-RF
RP-40	RP-080323	0611		HS-DSCH transport Format used for HS-SCCH type 3 requirements	A	8.2.0	8.3.0	MIMO-RF
RP-40	RP-080321			Correction to Rx Spurious Emissions	Α	8.2.0	8.3.0	TEI6
RP-40	RP-080321			Correction to Annex A.8.1	Α	8.2.0	8.3.0	
RP-41	RP-080629			Correction to F-DPCH TPC error rate requirement	A			TEI6
RP-41	RP-080629			TS25.101: UTRA UE Power Class	A	8.3.0	8.4.0	TEI6
RP-41	RP-080631			CQI reporting test for single link with varying lor/loc	F	8.3.0	8.4.0	TEI8
RP-41	RP-080631		1	MIMO CQI reporting bias tests	F	8.3.0	8.4.0	TEI8
RP-41	RP-080631			Clarification of HSDPA performance requirement applicability	F	8.3.0	8.4.0	TEI8
RP-41	RP-080625		1	CQI reporting test in fading conditions for 64QAM+MIMO	F	8.3.0	8.4.0	RANimp- 64QamMimo Hsdpa
RP-42	RP-080898	635	1	Introduction of fading CQI requirement at higher geometry for 64QAM operation	A	8.4.0	8.5.0	TEI7

RP-42	RP-080927	631	1	Clarification of HST propagation conditions	A	8.4.0	8.5.0	TEI7
RP-42	RP-080947	640	1	Introduction of E-AI requirements	В	8.4.0	8.5.0	RANImp- UplinkEnhStat e
RP-42	RP-080948	641		Introduction of CQI reporting test requirements for DC-HSDPA	В	8.4.0	8.5.0	RANimp- DCHSDPA
RP-42	RP-080948	639	3	Introduction of DC-HSDPA requirements	В	8.4.0	8.5.0	RANimp- DCHSDPA
RP-42	RP-080948	638	4	Introduction of FRC requirements for Dual cell HSDPA operation	В	8.4.0	8.5.0	RANimp- DCHSDPA
RP-42	RP-080942	636		CQI reporting test for STTD and CL1 with varying lor/loc	F	8.4.0	8.5.0	TEI8
				Correction to version number shown in title line		8.5.0	8.5.1	
RP-043	RP-090168	644	1	Correction to requirement tables for 9.2.1 and 9.2.4.	Α	8.5.1	8.6.0	TEI7
RP-043	RP-090168	648	1	Dual Cell HSDPA CQI Requirements in AWGN	F	8.5.1	8.6.0	RANimp- DCHSDPA
RP-043	RP-090168	658		Correction of HS-SCCH power in CQI tests	Α	8.5.1	8.6.0	TEI7
RP-043	RP-090168	649	1	Correction to FRC requirements for DC HSDPA	F	8.5.1	8.6.0	RANimp- DCHSDPA
RP-043	RP-090168	651		25.101 CR Tx-Rx frequency separation for DC- HSDPA	F	8.5.1	8.6.0	RANimp- DCHSDPA
RP-043	RP-090168	653		25.101 CR clarification of CQI reporting requirement for DC-HSDPA	F	8.5.1	8.6.0	RANimp- DCHSDPA
RP-043	RP-090196	650	1	25.101 CR E-DCH phase discontinuity test requirement	F	8.5.1	8.6.0	TEI8
RP-043	RP-090196	654	1	Corrections of out of band blocking	F	8.5.1	8.6.0	TEI8
RP-044	RP-090539	660		Clarifications for CQI Reporting Requirements of HSDPA. (Technically Endorsed CR in R4-50bis - R4-091235)	A	8.6.0	8.7.0	TEI7
RP-044	RP-090539	662		Correction to MIMO Propagation Conditions. (Technically Endorsed CR in R4-50bis - R4-091433)	F	8.6.0	8.7.0	TEI7
RP-044	RP-090539	666	1	Correction to FRC H-Set 8 definition	Α	8.6.0	8.7.0	TEI7
RP-044	RP-090546	667		Introduction of a new Compressed Mode pattern for E- UTRAN measurements	F	8.6.0	8.7.0	LTE-RF
RP-044	RP-090555	669		Removal of square brackets for DC-HSDPA Type 3i demodulation tests	F	8.6.0	8.7.0	TEI8
RP-044	RP-090559	661			В	8.7.0	9.0.0	RInImp9- UMTSLTE8
				Introduction of Extended UMTS800 requirements				00
RP-45	RP-090820		1	Update of DC HSDPA CQI requirements	A	9.0.0	9.1.0	TEI8
RP-46	RP-091286		1	Introduction of Extended UMTS1500 requirements for TS25.101 (Technically endorsed at RAN 4 52bis in R4- 093624)	В	9.1.0	9.2.0	UMTSLTE1 500
RP-46	RP-091290	679	1	Combination of DC-HSDPA and MIMO, CQI requirements (Technically endorsed at RAN 4 52bis in R4-093831)	В	9.1.0	9.2.0	RANimp- DC_MIMO
RP-46	RP-091290	680	2	Combination of DC-HSDPA and MIMO, FRC requirements (Technically endorsed at RAN 4 52bis in R4-093832)	В	9.1.0	9.2.0	RANimp- DC_MIMO
RP-46	RP-091290	681	1	Combination of DC-HSDPA and MIMO, RF requirements (Technically endorsed at RAN 4 52bis in R4-093833)	В	9.1.0	9.2.0	RANimp- DC_MIMO
RP-46	RP-091288	682	1	RF transmitter requirements for DC-HSUPA (Technically endorsed at RAN 4 52bis in R4-094072)	В	9.1.0	9.2.0	RANimp- DC_HSUPA
RP-46	RP-091289	683		25.101 CR introduction of Dual Band DC-HSDPA	В	9.1.0	9.2.0	RANimp- MultiBand_ DC_HSDPA
RP-46	RP-091291	689	2	(Technically Endorsed in R4-52, R4-093464)	В	9.1.0	9.2.0	RANimp-
		000	-	Introduction of requirements for TxAA falback mode		0.1.0	0.2.0	TxAA_nonM IMO
RP-46	RP-091296	690	L	Clarification of CQI reporting requirement applicability	Α	9.1.0	9.2.0	TEI8
RP-46	RP-091372	694		RAN5 related changes to enhanced CELL_FACH test case	А	9.1.0	9.2.0	TEI7

RP-47	RP-100248	702		Correction of H-Set 11 requirement for type 3 and type 3i receivers	A	9.2.0	9.3.0	TEI8
RP-47	RP-100270	697		Correction of CQI requirements for DC_MIMO	F	9.2.0	9.3.0	RANimp- DC MIMO
RP-47	RP-100271	703	1	HS-SCCH requirements for TxAA fallback extension	F	9.2.0	9.3.0	RANimp- TxAA_nonMI MO
RP-47	RP-100263	696		Introduction of UMTS in 800 MHz for Europe requirements in TS 25.101	В	9.2.0	9.3.0	UMTSLTE800 EU
RP-47	RP-100267	699	1	Tx-Rx frequency separation for DC-HSUPA	В	9.2.0	9.3.0	RANimp- DC_HSUPA
RP-47	RP-100267	698	2	Introduction of Rx core requirements for DC-HSUPA	В	9.2.0	9.3.0	RANimp- DC_HSUPA
RP-48	RP-100624	712		Editorial correction of note in varying geometry testcases	Α	9.3.0	9.4.0	TEI8
RP-48	RP-100626	704	1	25.101 CR spurious emission requirements for DC-HSUPA in band XX Small correction to parameters for testing MIMO FRC H-	F	9.3.0	9.4.0	RInImp9- UMTSLTE800 EU
RP-48	RP-100631	714	1	Set11/11A	F	9.3.0	9.4.0	TEI9
RP-48	RP-100631	713		DC-MIMO-HSDPA; Removal of brackets from CQI Requirements	F	9.3.0	9.4.0	TEI9
RP-49 RP-49	RP-100918 RP-100921	725 728		Corrections to CQI reporting requirements Correction to Rx core requirements for DC-HSUPA	A	9.4.0 9.4.0	9.5.0 9.5.0	TEI8 RANimp-
								DC_HSUPA
RP-49	RP-100921	722		Clarification of primary uplink frequency and secondary uplink frequency	F	9.4.0	9.5.0	4C_HSDPA- Core
RP-50	RP-101334	745 742	4	Correction to Band XII frequency range Correction to Downlink Physical Channels in DC-HSDPA	A	9.5.0	9.6.0	TEI8
RP-50	RP-101339	742	1	Tests	A	9.5.0	9.6.0	RANimp- DCHSDPA
RP-50	RP-101348	751	1	Correction to core requirements for DB-DC-HSDPA with bands II/IV combination	F	9.5.0	9.6.0	RANimp- MultiBand_D C_HSDPA
RP-50	RP-101348	747	2	Clarification on carrier spacing for DC-HSDPA with MIMO	F	9.5.0	9.6.0	RANimp- DC MIMO
RP-50	RP-101353	733	2	Introduction of frequency bands for 4C-HSDPA	В	9.6.0	10.0.0	4C_HSDPA- Core
RP-50	RP-101353	750	1	25.101 CR Introduction of Tx Core Requirements for DB- DC-HSDPA and dual band 4C-HSDPA with bands II/IV combination	В	9.6.0	10.0.0	4C_HSDPA- Core
RP-50	RP-101353	737	1	25.101 CR introduction of Rx core requirements for 4C- HSDPA	В	9.6.0	10.0.0	4C_HSDPA- Core
RP-50	RP-101361	748		Protection of E-UTRA Band 24	В	9.6.0	10.0.0	L_Band_LTE _ATC_MSS- Core
				Correction of reference to table 7.1aB in section 7.3.1		10.0.0	10.0.1	
RP-51	DD 110254	0754	4	Introduction of Rx core requirements for DB-DC-HSDPA	F	10.0.1	10.1.0	4C_HSDPA-
RP-51	RP-110354	0754	1	and dual band 4C-HSDPA Correction to Downlink Physical Channels in DC-HSDPA	F	10.0.1	10.1.0	Core RANimp-
RP-51	RP-110345	0765	1	receiver sensitivity Introduction of Tx core requirements for DB-DC-HSDPA	A	10.0.1	10.1.0	DCHSDPA
	RP-110354	0766	1	and dual band 4C-HSDPA for I/VIII and I/V band combinations	F			4C_HSDPA- Core
RP-51				HSDPA MIMO demodulation performance requirements		10.0.1	10.1.0	MIMO_HSDP
RP-51	RP-110407	0768	1	due to asymmetric P-CPICH/S-CPICH power settings	В	10.0.1	10.1.0	A-Perf RANimp-
RP-51	RP-110345	0771	-	DC-HSUPA Rx core requirements for band XI and band XXI		10.0.1	10.1.0	DC_HSUPA TEI8
RP-51 RP-51	RP-110341	0776	-	Correction of UARFCN range for Band XII Correction of OOBB interferer frequency ranges for Band	A	10.0.1	10.1.0	
RP-51	RP-110336	0779	-	XII 25.101 CR: Correction of out of band blocking for DB-DC-	А			LTE-RF
	RP-110355	0783	-	25.101 CR: Correction of out of band blocking for DB-DC- HSDPA configuration 3 (Rel-10)	А	10.0.1	10.1.0	DB_DC_HSD PA-Core
RP-51				25.101 CR Introduction of demodulation performance for		10.0.1	10.1.0	TEI9, RANimp- MultiBand_D
	RP-110346	0785	2	DB-DC-HSDPA (rel-10)	F	10.0.1	10.4.0	C_HSDPA
RP-51	RP-110355	0788	3	CR for the addition of the new band combinations and the TX core requirements for band I-XI and II-V	В	10.0.1	10.1.0	DB_DC_HSD PA-Core
RP-51	RP-110355	0789	3	CR for RX core requirements for band I-XI and II-V	в	10.0.1	10.1.0	DB_DC_HSD PA-Core
RP-51	RP-110341	0793	1	CR for the modification of the UE relative code domain power accuracy	A	10.0.1	10.1.0	TEI8
