# Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://ipr.etsi.org).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

# Foreword

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under <u>http://webapp.etsi.org/key/queryform.asp</u>.

# Modal verbs terminology

In the present document "shall", "shall not", "should", "should not", "may", "may not", "need", "need not", "will", "will not", "can" and "cannot" are to be interpreted as described in clause 3.2 of the <u>ETSI Drafting Rules</u> (Verbal forms for the expression of provisions).

"must" and "must not" are NOT allowed in ETSI deliverables except when used in direct citation.

# Foreword

This Technical Specification (TS) has been produced by the 3<sup>rd</sup> Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

## 1 Scope

The present document establishes the minimum RF characteristics of the FDD mode of UTRA for the User Equipment (UE).

# 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

# 3 Definitions, symbols and abbreviations

### 3.1 Definitions

For the purposes of the present document, the following definitions apply:

Assisting secondary serving HS-DSCH Cell: In addition to the serving HS-DSCH cell, a cell in the secondary downlink frequency, where the UE is configured to simultaneously monitor a HS-SCCH set and receive HS-DSCH if it is scheduled in that cell.

Assisting serving HS-DSCH Cell: In addition to the serving HS-DSCH cell, a cell in the same frequency, where the UE is configured to simultaneously monitor a HS-SCCH set and receive HS-DSCH if it is scheduled in that cell.

**Cell group**: A group of (one or two) Multiflow mode cells that have the same CPICH timing. The CQI reports for all the cells in a cell group are reported together in the same sub frame. The cells that belong to a cell group are indicated by higher layers.

**Enhanced performance requirements type 1**: This defines performance requirements which are optional for the UE. The requirements are based on UEs which utilise receiver diversity.

**Enhanced performance requirements type 2**: This defines performance requirements which are optional for the UE, The requirements are based on UEs which utilise a chip equaliser receiver structure.

**Enhanced performance requirements type 3**: This defines performance requirements which are optional for the UE, The requirements are based on UEs which utilise a chip equaliser receiver structure with receiver diversity.

**Enhanced performance requirements type 3i**: This defines performance requirements which are optional for the UE, The requirements are based on UEs which utilise an interference-aware chip equaliser receiver structure with receiver diversity.

**Power Spectral Density:** The units of Power Spectral Density (PSD) are extensively used in this document. PSD is a function of power versus frequency and when integrated across a given bandwidth, the function represents the mean power in such a bandwidth. When the mean power is normalised to (divided by) the chip-rate it represents the mean energy per chip. Some signals are directly defined in terms of energy per chip, (DPCH\_E<sub>c</sub>, E<sub>c</sub>, OCNS\_E<sub>c</sub> and S-CCPCH\_E<sub>c</sub>) and others defined in terms of PSD (I<sub>o</sub>, I<sub>or</sub>, and  $\hat{I}_{or}$ ). There also exist quantities that are a ratio of energy per chip to PSD (DPCH\_E<sub>c</sub>/I<sub>or</sub>, E<sub>c</sub>/I<sub>or</sub> etc.). This is the common practice of relating energy magnitudes in communication systems.

It can be seen that if both energy magnitudes in the ratio are divided by time, the ratio is converted from an energy ratio to a power ratio, which is more useful from a measurement point of view. It follows that an energy per chip of X dBm/3.84 MHz can be expressed as a mean power per chip of X dBm. Similarly, a signal PSD of Y dBm/3.84 MHz can be expressed as a signal power of Y dBm.

**Maximum Output Power:** This s a measure of the maximum power the UE can transmit (i.e. the actual power as would be measured assuming no measurement error) in a bandwidth of at least  $(1 + \alpha)$  times the chip rate of the radio access mode. The period of measurement shall be at least one timeslot. For DC-HSUPA the maximum output power is defined by the sum of the broadband transmit power of each carrier in the UE.

**Mean power:** When applied to a W-CDMA modulated signal this is the power (transmitted or received) in a bandwidth of at least  $(1 + \alpha)$  times the chip rate of the radio access mode. The period of measurement shall be at least one timeslot unless otherwise stated.

Multiflow mode: The UE is configured in Multiflow mode when it is configured with assisting serving HS-DSCH cell.

Nominal Maximum Output Power: This is the nominal power defined by the UE power class.

**Primary uplink frequency**: If a single uplink frequency is configured for the UE, then it is the primary uplink frequency. In case more than one uplink frequency is configured for the UE, then the primary uplink frequency is the frequency on which the E-DCH corresponding to the serving E-DCH cell associated with the serving HS-DSCH cell is transmitted. The association between a pair of uplink and downlink frequencies is indicated by higher layers.

**RRC filtered mean power:** The mean power as measured through a root raised cosine filter with roll-off factor  $\alpha$  and a bandwidth equal to the chip rate of the radio access mode.

- NOTE 1: The RRC filtered mean power of a perfectly modulated W-CDMA signal is 0.246 dB lower than the mean power of the same signal.
- NOTE 2: The roll-off factor  $\alpha$  is defined in section 6.8.1.

**Secondary serving HS-DSCH cell(s)**: In addition to the serving HS-DSCH cell, the set of cells where the UE is configured to simultaneously monitor an HS-SCCH set and receive the HS-DSCH if it is scheduled in that cell. There can be up to 7 secondary serving HS-DSCH cells.

**Secondary uplink frequency**: A secondary uplink frequency is a frequency on which an E-DCH corresponding to a serving E-DCH cell associated with a secondary serving HS-DSCH cell is transmitted. The association between a pair of uplink and downlink frequencies is indicated by higher layers.

**Time reference cell:** The (Serving or Assisting Serving, but not Secondary Serving or Assisting Secondary Serving) HS-DSCH cell that carries the HS-PDSCH acting as the time reference for the uplink HS-DPCCH when in Multiflow mode. There is one and only one Time reference cell.

**Throughput:** Number of information bits per second excluding CRC bits successfully received on HS-DSCH by a HSDPA capable UE.

 $1^{st}$  secondary serving HS-DSCH cell: If the UE is configured with two uplink frequencies, the  $1^{st}$  secondary serving HS-DSCH cell is the secondary serving HS-DSCH cell that is associated with the secondary uplink frequency. If the UE is configured with a single uplink frequency, the  $1^{st}$  secondary serving HS-DSCH cell is a secondary serving HS-DSCH cell is a secondary serving HS-DSCH cell whose index is indicated by higher layers.

## 3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply:

| 4C-HSDPA                                      | Four-Carrier HSDPA. HSDPA operation configured on 3 or 4 DL carriers.                                 |
|-----------------------------------------------|-------------------------------------------------------------------------------------------------------|
| ACLR                                          | Adjacent Channel Leakage power Ratio                                                                  |
| ACS                                           | Adjacent Channel Selectivity                                                                          |
| AICH                                          | Acquisition Indication Channel                                                                        |
| BER                                           | Bit Error Ratio                                                                                       |
| BLER                                          | Block Error Ratio                                                                                     |
| CQI                                           | Channel Quality Indicator                                                                             |
| CW                                            | Continuous Wave (un-modulated signal)                                                                 |
|                                               | A Dual Band Dual Cell HSDPA                                                                           |
| DC-HSDPA                                      | Dual Cell HSDPA                                                                                       |
| DC-HSUPA                                      | Dual Cell HSUPA                                                                                       |
| DCH                                           | Dedicated Channel, which is mapped into Dedicated Physical Channel.                                   |
| DIP                                           | Dominant Interferer Proportion ratio                                                                  |

# 4 General

# 4.1 Relationship between Minimum Requirements and Test Requirements

The Minimum Requirements given in this specification make no allowance for measurement uncertainty. The test specification 34.121 Annex F defines Test Tolerances. These Test Tolerances are individually calculated for each test. The Test Tolerances are used to relax the Minimum Requirements in this specification to create Test Requirements.

The measurement results returned by the test system are compared - without any modification - against the Test Requirements as defined by the shared risk principle.

The Shared Risk principle is defined in ETR 273 Part 1 sub-part 2 section 6.5.

### 4.2 Power Classes

For UE power classes 1 and 2, a number of RF parameter are not specified. It is intended that these are part of a later release.

### 4.3 Control and monitoring functions

This requirement verifies that the control and monitoring functions of the UE prevent it from transmitting if no acceptable cell can be found by the UE.

### 4.3.1 Minimum requirement

The power of the UE, as measured with a thermal detector, shall not exceed -30dBm if no acceptable cell can be found by the UE.

## 4.4 RF requirements in later releases

The standardisation of new frequency bands may be independent of a release. However, in order to implement a UE that conforms to a particular release but supports a band of operation that is specified in a later release, it is necessary to specify some extra requirements. TS 25.307 [9] specifies requirements on UEs supporting a frequency band that is independent of release.

NOTE: For terminals conforming to the 3GPP release of the present document, some RF requirements in later releases may be mandatory independent of whether the UE supports the bands specified in later releases or not. The set of requirements from later releases that is also mandatory for UEs conforming to the 3GPP release of the present document is determined by regional regulation.

# 5 Frequency bands and channel arrangement

# 5.1 General

The information presented in this subclause is based on a chip rate of 3.84 Mcps.

NOTE: Other chip rates may be considered in future releases.

## 5.2 Frequency bands

a) UTRA/FDD is designed to operate in the following paired bands:

| Operating | UL Frequencies              | DL frequencies              |  |
|-----------|-----------------------------|-----------------------------|--|
| Band      | UE transmit, Node B receive | UE receive, Node B transmit |  |
| I         | 1920 - 1980 MHz             | 2110 -2170 MHz              |  |
| 11        | 1850 -1910 MHz              | 1930 -1990 MHz              |  |
| III       | 1710-1785 MHz               | 1805-1880 MHz               |  |
| IV        | 1710-1755 MHz               | 2110-2155 MHz               |  |
| V         | 824 - 849 MHz               | 869-894 MHz                 |  |
| VI        | 830-840 MHz                 | 875-885 MHz                 |  |
| VII       | 2500-2570 MHz               | 2620-2690 MHz               |  |
| VIII      | 880 - 915 MHz               | 925 - 960 MHz               |  |
| IX        | 1749.9-1784.9 MHz           | 1844.9-1879.9 MHz           |  |
| Х         | 1710-1770 MHz               | 2110-2170 MHz               |  |
| XI        | 1427.9 - 1447.9 MHz         | 1475.9 - 1495.9 MHz         |  |
| XII       | 699 – 716 MHz               | 729 – 746 MHz               |  |
| XIII      | 777 - 787 MHz               | 746 - 756 MHz               |  |
| XIV       | 788 – 798 MHz               | 758 – 768 MHz               |  |
| XV        | Reserved                    | Reserved                    |  |
| XVI       | Reserved                    | Reserved                    |  |
| XVII      | Reserved                    | Reserved                    |  |
| XVIII     | Reserved                    | Reserved                    |  |
| XIX       | 830 – 845MHz                | 875 – 890 MHz               |  |
| XX        | 832 – 862 MHz               | 791 – 821 MHz               |  |
| XXI       | 1447.9 – 1462.9 MHz         | 1495.9 – 1510.9 MHz         |  |
| XXII      | 3410 – 3490 MHz             | 3510 – 3590 MHz             |  |
| XXV       | 1850 – 1915 MHz             | 1930 – 1995 MHz             |  |
| XXVI      | 814 – 849 MHz               | 859 – 894 MHz               |  |

#### Table 5.0: UTRA FDD frequency bands

- b) Deployment in other frequency bands is not precluded
- c) DB-DC-HSDPA is designed to operate in the following configurations:

| DB-DC-HSDPA<br>Configuration | UL Band   | DL<br>Band A | DL<br>Band B |
|------------------------------|-----------|--------------|--------------|
| 1                            | I or VIII | I            | VIII         |
| 2                            | II or IV  | II           | IV           |
| 3                            | l or V    | I            | V            |
| 4                            | I or XI   | I            | XI           |
| 5                            | ll or V   | II           | V            |

#### Table 5.0aE Single band NC-4C-HSDPA configurations

## 5.3 TX-RX frequency separation

a) UTRA/FDD is designed to operate with the following TX-RX frequency separation

| Operating Band | TX-RX frequency separation |  |  |
|----------------|----------------------------|--|--|
| I              | 190 MHz                    |  |  |
| I              | 80 MHz.                    |  |  |
| III            | 95 MHz.                    |  |  |
| IV             | 400 MHz                    |  |  |
| V              | 45 MHz                     |  |  |
| VI             | 45 MHz                     |  |  |
| VII            | 120 MHz                    |  |  |
| VIII           | 45 MHz                     |  |  |
| IX             | 95 MHz                     |  |  |
| Х              | 400 MHz                    |  |  |
| XI             | 48 MHz                     |  |  |
| XII            | 30 MHz                     |  |  |
| XIII           | 31 MHz                     |  |  |
| XIV            | 30 MHz                     |  |  |
| XIX            | 45 MHz                     |  |  |
| XX             | 41 MHz                     |  |  |
| XXI            | 48 MHz                     |  |  |
| XXII           | 100 MHz                    |  |  |
| XXV            | 80 MHz                     |  |  |
| XXVI           | 45MHz                      |  |  |

#### Table 5.0A: TX-RX frequency separation

- b) UTRA/FDD can support both fixed and variable transmit to receive frequency separation.
- c) The use of other transmit to receive frequency separations in existing or other frequency bands shall not be precluded.
- d) When configured to operate on dual cells in the DL with a single UL frequency, the TX-RX frequency separation in Table 5.0A shall be applied for the serving HS-DSCH cell. For bands XII, XIII and XIV, the TX-RX frequency separation in Table 5.0A shall be the minimum spacing between the UL and either of the DL carriers.
- e) When configured to operate on dual cells in both the DL and UL, the TX-RX frequency separation in Table 5.0A shall be applied to the primary UL frequency and DL frequency of the serving HS-DSCH cell, and to the secondary UL frequency and the frequency of the secondary serving HS-DSCH cell respectively.
- f) When configured to operate on single/dual band 4C-HSDPA or single band 8C-HSDPA or single band NC-4C-HSDPA with a single UL frequency, the TX-RX frequency separation in Table 5.0A shall be applied for the DL frequency of the serving HS-DSCH cell. When configured to operate on single/dual band 4C-HSDPA or single

band 8C-HSDPA or single band NC-4C-HSDPA with dual UL frequencies, the TX-RX frequency separation in Table 5.0A shall be applied to the primary UL frequency and DL frequency of the serving HS-DSCH cell, and to the secondary UL frequency and the frequency of the 1<sup>st</sup> secondary serving HS-DSCH cell respectively.

g) For bands XII, XIII and XIV, all the requirements in TS 25.101 are applicable only for a single uplink carrier frequency, however dual cell uplink operation may be considered in future releases.

### 5.4 Channel arrangement

### 5.4.1 Channel spacing

The nominal channel spacing is 5 MHz, but this can be adjusted to optimise performance in a particular deployment scenario. In DC-HSDPA and DB-DC-HSDPA mode, the UE receives two cells simultaneously. In context of DC-HSDPA and DB-DC-HSDPA, a cell is characterized by a combination of scrambling code and a carrier frequency, see [21.905].

#### 5.4.2 Channel raster

The channel raster is 200 kHz, for all bands which means that the centre frequency must be an integer multiple of 200 kHz. In addition a number of additional centre frequencies are specified according to table 5.1A, which means that the centre frequencies for these channels are shifted 100 kHz relative to the general raster.

#### 5.4.3 Channel number

The carrier frequency is designated by the UTRA Absolute Radio Frequency Channel Number (UARFCN). For each operating Band, the UARFCN values are defined as follows:

| Uplink:   | $N_U = 5 * (F_{UL} - F_{UL\_Offset}),$        | for the carrier frequency range $F_{UL\_low} \leq F_{UL} \leq \ F_{UL\_high}$ |
|-----------|-----------------------------------------------|-------------------------------------------------------------------------------|
| Downlink: | $N_D = 5 * (F_{DL} - F_{DL \text{ Offset}}),$ | for the carrier frequency range $F_{DL_{low}} \le F_{DL} \le F_{DL_{high}}$   |

For each operating Band,  $F_{UL\_Offset}$ ,  $F_{UL\_low}$ ,  $F_{UL\_low}$ ,  $F_{DL\_Offset}$ ,  $F_{DL\_low}$  and  $\Box$   $F_{DL\_high}$  are defined in Table 5.1 for the general UARFCN. For the additional UARFCN,  $F_{UL\_Offset}$ ,  $F_{DL\_Offset}$  and the specific  $F_{UL}$  and  $F_{DL}$  are defined in Table 5.1A.

|      | UPLINK (UL)                  |                     |                          |                              | WNLINK (DL)     |                          |
|------|------------------------------|---------------------|--------------------------|------------------------------|-----------------|--------------------------|
|      |                              |                     | nit, Node B receive      |                              | ve, Node B trar |                          |
| Band | UARFCN                       |                     | uency (F <sub>∪L</sub> ) | UARFCN                       | Carrier freq    | uency (F <sub>DL</sub> ) |
|      | formula offset               | range               | [MHz]                    | formula offset               | range           | [MHz]                    |

NOTE: If the UE is on a network with Mobile Country Code set to Japan then it may assume that any DL UARFCN sent by the network from the overlapping region of Band V and Band VI is from Band VI. If the UE is on a network with a Mobile Country Code other than Japan then it may assume that any DL UARFCN sent by the network from the overlapping region of Band V and Band VI is from Band V.

# 6 Transmitter characteristics

### 6.1 General

Unless otherwise stated, the transmitter characteristics are specified at the antenna connector of the UE. For UE with integral antenna only, a reference antenna with a gain of 0 dBi is assumed. Transmitter characteristics for UE(s) with multiple antennas/antenna connectors are FFS.

The UE antenna performance has a significant impact on system performance, and minimum requirements on the antenna efficiency are therefore intended to be included in future versions of the present document. It is recognised that different requirements and test methods are likely to be required for the different types of UE.

UEs supporting DC-HSUPA shall support both minimum requirements, as well as additional requirements for DC-HSUPA.

Unless otherwise stated, for the additional requirements for DC-HSUPA, all the parameters in clause 6 are defined using the UL E-DCH reference measurement channel, specified in subclause A.2.6. For the additional requirements for DC-HSUPA, the spacing of the carrier frequencies of the two cells shall be 5 MHz.

UEs supporting Open-Loop uplink Transmitter Diversity shall support both minimum requirements for one of transmit antenna connectors, which one to be tested shall be declared by the manufacturer, and additional requirements for UL OLTD. In addition, the additional requirements for UL OLTD are applicable only in the case when equal power is transmitted from two active antenna ports.

DC-HSUPA and UL OLTD do not operate simultaneously in the UE.

UEs supporting UL CLTD shall support both minimum requirements, as well as additional requirements for UL CLTD.

The requirements in clause 6 for UEs supporting UL CLTD are specified for UL CLTD activation states 1, 2, 3 which are defined in sub-clause 4.6C.2.2.3 in TS 25.212[10].

DC-HSUPA and UL CLTD do not operate simultaneously in the UE.

UEs supporting UL MIMO shall support both minimum requirements, as well as additional requirements for UL MIMO.

The requirements in clause 6 specified for UL MIMO are applicable for UL MIMO rank-2 transmission. The requirements for UL MIMO rank-1 transmission are covered by UL CLTD requirements. UL MIMO rank-1 and rank-2 transmissions are defined in clause 11 of TS25.214 [8].

DC-HSUPA and UL MIMO do not operate simultaneously in the UE.

### 6.2 Transmit power

#### 6.2.1 UE maximum output power

The following Power Classes define the nominal maximum output power. The nominal power defined is the broadband transmit power of the UE, i.e. the power in a bandwidth of at least  $(1+\alpha)$  times the chip rate of the radio access mode. The period of measurement shall be at least one timeslot. For DC-HSUPA, the nominal transmit power is defined by the sum of the broadband transmit power of each carrier in the UE.

| Operating | Power | Class 1 | Power | Class 2 | Power | Class 3 | Power C | lass 3bis | Power | Class 4 |
|-----------|-------|---------|-------|---------|-------|---------|---------|-----------|-------|---------|
| Band      | Power | Tol     | Power | Tol     | Power | Tol     | Power   | Tol       | Power | Tol     |
|           | (dBm) | (dB)    | (dBm) | (dB)    | (dBm) | (dB)    | (dBm)   | (dB)      | (dBm) | (dB)    |

#### Table 6.1: UE Power Classes

| Band I    | +33        | +1/-3      | +27         | +1/-3      | +24        | +1/-3         | 23          | +2/-2        | +21      | +2/-2   |
|-----------|------------|------------|-------------|------------|------------|---------------|-------------|--------------|----------|---------|
| Band II   | -          | -          | -           | -          | +24        | +1/-3         | 23          | +2/-2        | +21      | +2/-2   |

NOTE: The tolerance allowed for the nominal maximum output power applies even for the multi-code DPDCH transmission mode.

For the UE which supports DB-DC-HSDPA configuration in Table 6.1aB, the lower side of the tolerance in Table 6.1 is allowed to be adjusted by the amount given in Table 6.1aB for the applicable bands.

| DB-DC-HSDPA<br>Configuration                                                                                                                                                  | Maximum allowed adjustment<br>in lower side of tolerance (dB) | Applicable bands |  |  |  |

| I-2-VIII-1, I-3-VIII-1, I-2-VIII-<br>2, I-1-VIII-2                                                                                                                            | -0.3                                                          | I, VIII          |  |  |  |
| II-1-IV-2, II-2-IV-1, II-2-IV-2                                                                                                                                               | -1                                                            | II, IV           |  |  |  |
| I-1-V-2, I-2-V-1, I-2-V-2                                                                                                                                                     | -0.3                                                          | I, V             |  |  |  |
| II-1-V-2                                                                                                                                                                      | -0.3                                                          | II, V            |  |  |  |
| NOTE: The requirements reflect what can be achieved with the present state of the art technology. They shall be reconsidered when the state of the art technology progresses. |                                                               |                  |  |  |  |

For the UE which supports E-UTRA inter-band carrier aggregation, the lower side of the tolerance in Table 6.1 is allowed to be decreased by the amount given in Table 6.2.5A-3 of TS 36.101[11] for those UTRA operating bands

corresponding to the E-UTRA operating bands that belong to the supported inter-band carrier aggregation configurations. The tolerance in Table 6.2.5A-3 of TS 36.101[11] does not apply to supported UTRA operating bands with frequency range below 1 GHz that correspond to the E-UTRA operating bands that belong to the supported inter-band carrier aggregation configurations when such bands are belonging only to band combination(s) where one band is <1GHz and another band is >1.7GHz and there is no harmonic relationship between the low band UL and high band DL.

In case the UE supports DB-DC-HSDPA or dual band 4C-HSDPA configurations and one or more of the E-UTRA inter-band carrier aggregation configurations listed in Table 6.2.5A-3 of TS36.101[11] with a UTRA operating band that belongs to UTRA and E-UTRA carrier aggregation configurations, then

- When the UTRA operating band frequency range is ≤ 1GHz, the applicable additional tolerance shall be the average of the applicable tolerances, truncated to one decimal place for that operating band among the supported DB-DC-HSDPA, dual band 4C-HSDPA, and E-UTRA CA configurations, with the DB-DC-HSDPA, dual carrier 4C-HSDPA, and E-UTRA CA configurations counted separately. In case there is a harmonic relation between low band UL and high band DL, then the maximum tolerance among the different supported carrier aggregation configurations involving such band shall be applied
- When the UTRA operating band frequency range is >1GHz, the applicable additional tolerance shall be the maximum tolerance that applies for that operating band among the supported DB-DC-HSDPA, dual band 4C-HSDPA, and E-UTRA CA configurations.

### 6.2.1A UE maximum output power for UL OLTD

For UE with two active transmit antenna connectors in UL OLTD operation, the maximum output power is specified in Table 6.1aD. The nominal transmit power is defined by the sum of transmit power at each UE antenna connector.

| Operating                                                                       | Power      | Class 3     | Power C | lass 3bis |  |  |
|---------------------------------------------------------------------------------|------------|-------------|---------|-----------|--|--|
| Band                                                                            | Power      | Tol         | Power   | Tol       |  |  |
|                                                                                 | (dBm)      | (dB)        | (dBm)   | (dB)      |  |  |

Table 6.1aD: UE Power Classes for UL OLTD

# 6.2.1B UE maximum output power for UL CLTD

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the nominal maximum output power is specified in Table 6.1aE. The nominal transmit power is defined by the sum of transmit power at each transmit antenna connector.

For UE configured in UL CLTD activation state 2 or activation state 3, the nominal maximum output power specified in sub-clause 6. 2.1 applies at the active transmit antenna connector.

| Operating                                | Power                                        | Class 3 | Power C   | lass 3bis |  |

Table 6.1aE: UE Power Classes for UL CLTD

### 6.2.1C UE maximum output power for UL MIMO

For UE with two active transmit antenna connectors in UL MIMO operation, the nominal maximum output power is specified in Table 6.1aF. The nominal transmit power is defined by the sum of transmit power at each transmit antenna connector.

Table 6.1aF: UE Power Classes for UL MIMO

#### 6.2.2 UE maximum output power with HS-DPCCH and E-DCH

The Maximum Power Reduction (MPR) for the nominal maximum output power defined in 6.2.1 is specified in table 6.1A for the values of  $\beta_c$ ,  $\beta_d$ ,  $\beta_{hs}$ ,  $\beta_{ec}$  and  $\beta_{ed}$  defined in [8] fully or partially transmitted during a DPCCH timeslot

Table 6.1A: UE maximum output power with HS-DPCCH and E-DCH

| UE transmit channel configuration                                                                                                                                                                   | CM (dB)            | MPR (dB)      |  |  |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|---------------|--|--|
| For all combinations of; DPDCH, DPCCH, HS-<br>DPCCH, E-DPDCH and E-DPCCH                                                                                                                            | $0 \leq CM \leq 4$ | MAX (CM-1, 0) |  |  |
| Note 1: CM = 1 for $\beta_c/\beta_d$ =12/15, $\beta_{hs}/\beta_c$ =24/15. For all other combinations of DPDCH, DPCCH, HS-DPCCH, E-DPDCH and E-DPCCH the MPR is based on the relative CM difference. |                    |               |  |  |

Where Cubic Metric (CM) is based on the UE transmit channel configuration and is given by

$$CM = CEIL \{ [20 * log10 ((v_norm^3)_{rms}) - 20 * log10 ((v_norm_ref^3)_{rms})] / k, 0.5 \}$$

Where

- CEIL { x, 0.5 } means rounding upwards to closest 0.5dB, i.e. CM [ [0, 0.5, 1.0, 1.5, 2.0, 2.5, 3.0, 3.5]
- k is 1.85 for signals where all channelisations codes meet the following criteria CSF, N where N< SF/2
- k is 1.56 for signals were any channelisations codes meet the following criteria  $C_{SF, N}$  where  $N \ge SF/2$
- v\_norm is the normalized voltage waveform of the input signal
- v\_norm\_ref is the normalized voltage waveform of the reference signal (12.2 kbps AMR Speech) and

-  $20 * \log 10 ((v_norm_ref^3)_{rms}) = 1.52 \text{ dB}$ 

### 6.2.2A UE maximum output, power for DC-HSUPA

The Maximum Power Reduction (MPR) for the nominal maximum output power defined in 6.2.1 is specified for the values of  $\beta_c$ ,  $\beta_{hs}$ ,  $\beta_{ec}$  and  $\beta_{ed}$  defined in [8] fully or partially transmitted during a DPCCH timeslot, and defined through calculation of the Raw Cubic Metric (Raw CM) which is based on the UE transmit channel configuration and is given by

Raw CM =  $20 * \log_{10} ((v_n \text{ orm}^3)_{\text{rms}}) - 20 * \log_{10} ((v_n \text{ orm}_{\text{ref}}^3)_{\text{rms}})$ 

where

- v\_norm is the normalized voltage waveform of the input signal
- v\_norm\_ref is the normalized voltage waveform of the reference signal (12.2 kbps AMR Speech) and
- $20 * \log 10 ((v_norm_ref^3)_{rms}) = 1.52 \text{ dB}$

For any DC-HSUPA signal not employing 16QAM modulation on any of the carriers, the MPR is specified in Table 6.1AA.

#### Table 6.1AA: UE maximum output power for DC-HSUPA signals not employing 16QAM modulation on any of the carriers

| UE transmit channel configuration                                 | CM (dB)                | MPR (dB)         |
|-------------------------------------------------------------------|------------------------|------------------|
| For all combinations of; DPCCH, HS-DPCCH, E-<br>DPDCH and E-DPCCH | $0.22 \le CM \le 3.72$ | MAX (CM-0.72, 0) |

where Cubic Metric (CM) is based on the Raw CM and is given by

 $CM = CEIL \{ Raw CM / k, 0.22 \}$ 

where

- CEIL { x, 0.22 } means rounding upwards to closest 0.22dB with 0.5 dB granularity, i.e. CM = [0.22, 0.72, 1.22, 1.72, 2.22, 2.72, 3.22, 3.72]
- k is 1.66

For any DC-HSUPA signal employing 16QAM modulation on any of the carriers, the MPR is specified in Table 6.1AB..

#### Table 6.1AB: UE maximum output power for DC-HSUPA signals employing 16QAM modulation on any of the carriers

| UE transmit channel configuration                                 | CM (dB)                  | MPR (dB) |
|-------------------------------------------------------------------|--------------------------|----------|
| For all combinations of; DPCCH, HS-DPCCH, E-<br>DPDCH and E-DPCCH | $[0.22 \le CM \le 3.72]$ | [CM+0.8] |

where Cubic Metric (CM) is based on the Raw CM and is given by

$$[CM = CEIL \{ Raw CM / k, 0.2 \}]$$

where

- CEIL { x, 0.2 } means rounding upwards to closest 0.2dB with 0.5 dB granularity, i.e. CM = [0.2, 0.7, 1.2, 1.7, 2.2, 2.7, 3.2, 3.7]

- k is 1.66.

The reference measurement channels for the requirements in subclause 6.2.2A are provided in subclause A.2.8.

# 6.2.2B UE maximum output power with HS-DPCCH and E-DCH for UL OLTD

For the UE with two active transmit antenna connectors in UL OLTD operation, the allowed Maximum Power Reduction (MPR) for the nominal maximum output power of each antenna is specified in Table 6.1A. The amount of applied power reduction on each antenna shall be the same.

NOTE: CM is measured at each transmit antenna connector.

# 6.2.2C UE maximum output power with HS-DPCCH and E-DCH for UL CLTD

The Maximum Power Reduction (MPR) for the nominal maximum output power defined in 6.2.1 is specified in table 6.1AB for the values of  $\beta_c$ ,  $\beta_d$ ,  $\beta_{hs}$ ,  $\beta_{ec}$ ,  $\beta_{ed}$  and  $\beta_{sc}$  defined in [8] fully or partially transmitted during a DPCCH timeslot

#### Table 6.1AB: UE maximum output power with HS-DPCCH and E-DCH for UL CLTD

| UE transmit channel configuration          | CM (dB)          | MPR (dB)      |
|--------------------------------------------|------------------|---------------|
| For all combinations of; DPDCH, DPCCH, HS- | $0 \le CM \le 4$ | MAX (CM-1, 0) |
| DPCCH, E-DPDCH, E-DPCCH and S-DPCCH        |                  |               |

Where Cubic Metric (CM) is based on the UE transmit channel configuration and is given by

$$CM = CEIL \{ [20 * log10 ((v_norm^3)_{rms}) - 20 * log10 ((v_norm_ref^3)_{rms})] / k, 0.5 \}$$

Where

- CEIL { x, 0.5 } means rounding upwards to closest 0.5dB, i.e. CM = [0, 0.5, 1.0, 1.5, 2.0, 2.5, 3.0, 3.5]
- k is 1.85 for signals where all channelisations codes meet the following criteria  $C_{SF, N}$  where N< SF/2
- k is 1.56 for signals were any channelisations codes meet the following criteria  $C_{SF, N}$  where N  $\ge$  SF/2
- v\_norm is the normalized voltage waveform of the input signal
- v\_norm\_ref is the normalized voltage waveform of the reference signal (12.2 kbps AMR Speech) and
- $20 * \log 10 ((v_norm_ref^3)_{rms}) = 1.52 \text{ dB}$

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the allowed Maximum Power Reduction (MPR) for the nominal maximum output power of each antenna is specified in Table 6.1AA. The amount of applied power reduction on each antenna shall be the same.

NOTE: CM is measured at each transmit antenna connector.

For UE configured in UL CLTD activation state 2 or activation state 3, the allowed Maximum Power Reduction (MPR) for the nominal maximum output power specified in sub-clause 6.2.2 applies at the active transmit antenna connector.

#### 6.2.2D UE maximum output power with HS-DPCCH and E-DCH for UL MIMO

The Maximum Power Reduction (MPR) for the nominal maximum output power defined in 6.2.1 is specified in table 6.1AC for the values of  $\beta_{c}$ ,  $\beta_{hs}$ ,  $\beta_{ec}$ ,  $\beta_{sec}$ ,  $\beta_{ed}$ ,  $\beta_{sed}$  and  $\beta_{sc}$  defined in [8] fully or partially transmitted during a DPCCH timeslot

Table 6.1AC: UE maximum output power with HS-DPCCH and E-DCH for UL MIMO

| UE transmit channel configuration                                                                  | CM (dB)          | MPR (dB)      |
|----------------------------------------------------------------------------------------------------|------------------|---------------|
| For all combinations of; DPCCH, HS-DPCCH, E-<br>DPDCH, S-E-DPDCH E-DPCCH, S-E-DPCCH and<br>S-DPCCH | $0 \le CM \le 4$ | MAX (CM-1, 0) |

Where Cubic Metric (CM) is based on the UE transmit channel configuration and is given by

 $CM = CEIL \{ [20 * log10 ((v_norm^3)_{rms}) - 20 * log10 ((v_norm_ref^3)_{rms})] / k, 0.5 \}$ 

Where

- CEIL { x, 0.5 } means rounding upwards to closest 0.5dB, i.e. CM = [0, 0.5, 1.0, 1.5, 2.0, 2.5, 3.0, 3.5]
- k is 1.85 for signals where all channelisations codes meet the following criteria  $C_{SF, N}$  where N< SF/2
- k is 1.56 for signals were any channelisations codes meet the following criteria  $C_{SF, N}$  where N  $\ge$  SF/2
- v\_norm is the normalized voltage waveform of the input signal
- v\_norm\_ref is the normalized voltage waveform of the reference signal (12.2 kbps AMR Speech) and
- $20 * \log 10 ((v_norm_ref^3)_{rms}) = 1.52 \text{ dB}$

For UE with two active transmit antenna connectors in UL MIMO operation, the allowed Maximum Power Reduction (MPR) for the nominal maximum output power of each antenna is specified in Table 6.1AC. The amount of applied power reduction on each antenna shall be the same.

NOTE: CM is measured at each transmit antenna connector.

#### 6.2.3 UE Relative code domain power accuracy

The UE Relative code domain power accuracy is a measure of the ability of the UE to correctly set the level of individual code powers relative to the total power of all active codes. When the UE uses 16QAM modulation on any of the uplink code channels the IQ origin offset power shall be removed from the Measured CDP ratio; however, the removed relative IQ origin offset power (relative carrier leakage power) also has to satisfy the applicable requirement. The measure of accuracy is the difference between two dB ratios:

UE Relative CDP accuracy = (Measured CDP ratio) - (Nominal CDP ratio)

where

Measured CDP ratio =  $10*\log((Measured code power) / (Measured total power of all active codes))$ 

Nominal CDP ratio = 10\*log((Nominal CDP) / (Sum of all nominal CDPs))

The nominal CDP of a code is relative to the total of all codes and is derived from beta factors.

When the UE uses 16QAM modulation a correction factor shall be applied to the  $\beta_{ed}$  value used to compute the Nominal CDP equal to  $\{A_1*(0.4472)^2 + A_2*(1.3416)^2 + A_3*(-0.4472)^2 + A_4*(-1.3416)^2\}^{1/2}$  where  $A_1$ ,  $A_2$ ,  $A_3$  and  $A_4$  are the fractions of symbols (00, 01, 10, 11 respectively) transmitted during the test.

The sum of all nominal CDPs will equal 1 by definition.

NOTE: The above definition of UE relative CDP accuracy is independent of variations in the actual total power of the signal and of noise in the signal that falls on inactive codes.

The required accuracy of the UE relative CDP is given in table 6.1B. The UE relative CDP accuracy shall be maintained over the period during which the total of all active code powers remains unchanged or one timeslot, whichever is the longer.

| Nominal CDP ratio  | Accuracy (dB) |
|--------------------|---------------|
| ≥ -10 dB           | ±1.5          |
| -10 dB to ≥ -15 dB | ±2.0          |
| -15 dB to ≥ -20 dB | ±2.5          |
| -20 dB to ≥ -30 dB | ±3.0          |

#### Table 6.1B: UE Relative CDP accuracy

### 6.2.3A UE Relative code domain power accuracy for DC-HSUPA

The requirement and corresponding measurements apply to each individual carrier when the total power in each of the assigned carriers is equal to each other

The UE Relative code domain power accuracy is a measure of the ability of the UE to correctly set the level of individual code powers in a carrier relative to the total power of all active codes in that carrier. When the UE uses 16QAM modulation on any of the uplink code channels in a carrier the IQ origin offset power measured in that carrier shall be removed from the Measured CDP ratio in that carrier; however, the removed relative IQ origin offset power (relative carrier leakage power) measured in that carrier also has to satisfy the applicable requirement in that carrier. The measure of accuracy is the difference between two dB ratios measured per carrier configured on the uplink:

UE Relative CDP accuracy = (Measured CDP ratio) - (Nominal CDP ratio)

where

Measured CDP ratio =  $10*\log((Measured code power) / (Measured total power of all active codes))$ 

Nominal CDP ratio = 10\*log((Nominal CDP) / (Sum of all nominal CDPs))

The nominal CDP of a code is relative to the total of all codes in each carrier and is derived from beta factors. The sum of all nominal CDPs will equal 1 by definition.

NOTE: The above definition of UE relative CDP accuracy is independent of variations in the actual total power of the signal in each carrier and of noise in the signal that falls on inactive codes.

The required accuracy of the UE relative CDP is given in table 6.1B. The UE relative CDP accuracy shall be maintained over the period during which the total of all active code powers remains unchanged or one timeslot, whichever is the longer.

The reference measurement channels for the requirements in subclause 6.2.3A are provided in subclause A.2.6 and A.2.7.

#### 6.2.3B UE Relative code domain power accuracy for UL OLTD

For the UE with two active transmit antenna connectors in UL OLTD operation, the relative code domain power accuracy specified in sub-clause 6.2.3 applies at each transmit antenna connector.

### 6.2.3C UE Relative code domain power accuracy for UL CLTD

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the relative code domain power accuracy specified in sub-clause 6.2.3 applies at each transmit antenna connector.

For UE configured in UL CLTD activation state 2 or activation state 3, the relative code domain power accuracy specified in sub-clause 6.2.3 applies at the active transmit antenna connector.

#### 6.2.3D UE Relative code domain power accuracy for UL MIMO

For UE with two active transmit antenna connectors in UL MIMO operation, the relative code domain power accuracy specified in sub-clause 6.2.3 applies at each transmit antenna connector.

### 6.3 Frequency Error

The UE modulated carrier frequency shall be accurate to within  $\pm 0.1$  PPM observed over a period of one timeslot compared to the carrier frequency received from the Node B. For the PRACH preambles the measurement interval is lengthened to 3904 chips (being the 4096 chip nominal preamble period less a 25 µs transient period allowance at each end of the burst). These signals will have an apparent error due to Node B frequency error and Doppler shift. The signals from the Node B must be averaged over sufficient time that errors due to noise or interference are within the above  $\pm 0.1$ PPM figure. The UE shall use the same frequency source for both RF frequency generation and the chip clock.

## 6.3A Frequency Error for DC-HSUPA

The UE modulated carrier frequencies shall be accurate to within  $\pm 0.1$  PPM observed over a period of one timeslot compared to the average of the carrier frequencies received from the Node B. When the signal from one Node B cell is out-of-sync, the UE modulated carrier frequency shall be compared to the remaining carrier frequency received from the other Node B cell. These signals will have an apparent error due to Node B frequency error and Doppler shift. The signals from the Node B must be averaged over sufficient time such that errors due to noise or interference are within the above  $\pm 0.1$ PPM figure. The frequency error of the carrier frequencies received from the Node B shall be the same in average. The UE shall use the same frequency source for both RF frequency generation and the chip clock.

## 6.3B Frequency error for UL OLTD

The UE modulated carrier frequency at each transmit antenna connector shall be accurate to within  $\pm 0.1$  PPM observed over a period of one timeslot compared to the carrier frequency received from the Node B. These signals will have an apparent error due to Node B frequency error and Doppler shift. The signals from the Node B must be averaged over sufficient time that errors due to noise or interference are within the above  $\pm 0.1$ PPM figure. The UE shall use the same frequency source for both RF frequency generation and the chip clock.

### 6.3C Frequency error for UL CLTD

The UE modulated carrier frequency at each transmit antenna connector shall be accurate to within  $\pm 0.1$  PPM observed over a period of one timeslot compared to the carrier frequency received from the Node B. These signals will have an apparent error due to Node B frequency error and Doppler shift. The signals from the Node B must be averaged over sufficient time that errors due to noise or interference are within the above  $\pm 0.1$ PPM figure. The UE shall use the same frequency source for both RF frequency generation and the chip clock.

### 6.3D Frequency error for UL MIMO

For UE supporting UL MIMO, the UE modulated carrier frequency at each transmit antenna connector shall be accurate to within  $\pm 0.1$  PPM observed over a period of one timeslot compared to the carrier frequency received from the Node B. These signals will have an apparent error due to Node B frequency error and Doppler shift. The signals from the Node B must be averaged over sufficient time that errors due to noise or interference are within the above  $\pm 0.1$ PPM figure. The UE shall use the same frequency source for both RF frequency generation and the chip clock.

### 6.4 Output power dynamics

Power control is used to limit the interference level.

#### 6.4.1 Open loop power control

Open loop power control is the ability of the UE transmitter to sets its output power to a specific value. The open loop power control tolerance is given in Table 6.3

## 6.4.1.1 Minimum requirement

The UE open loop power is defined as the mean power in a timeslot or ON power duration, whichever is available.

#### Table 6.3: Open loop power control tolerance

| Conditions         | Tolerance |
|--------------------|-----------|
| Normal conditions  | ± 9 dB    |
| Extreme conditions | ± 12 dB   |

## 6.4.1.1A Additional requirement for DC-HSUPA

The open loop power control tolerance per carrier is given in Table 6.3.

# 6.4.2 Inner loop power control in the uplink

Inner loop power control in the Uplink is the ability of the UE transmitter to adjust its output power in accordance with one or more TPC commands received in the downlink.

## 6.4.2.1 Power control steps

The power control step is the change in the UE transmitter output power in response to a single TPC command, TPC\_cmd, derived at the UE.

#### 6.4.2.1.1 Minimum requirement

The UE transmitter shall have the capability of changing the output power with a step size of 1, 2 and 3 dB according to the value of  $\Delta_{TPC}$  or  $\Delta_{RP-TPC}$ , in the slot immediately after the TPC\_cmd as follows

- a) The transmitter output power step due to inner loop power control shall be within the range shown in Table 6.4.
- b) The transmitter average output power step due to inner loop power control shall be within the range shown in Table 6.5. Here a TPC\_cmd group is a set of TPC\_cmd values derived from a corresponding sequence of TPC commands of the same duration.

The inner loop power step is defined as the relative power difference between the mean power of the original (reference) timeslot and the mean power of the target timeslot, not including the transient duration. The transient duration is from  $25\mu$ s before the slot boundary to  $25\mu$ s after the slot boundary.

|          | Transmitter power control range |                |         |                               |         |                |  |
|----------|---------------------------------|----------------|---------|-------------------------------|---------|----------------|--|
| TPC_ cmd | 1 dB ste                        | 1 dB step size |         | 1 dB step size 2 dB step size |         | 3 dB step size |  |
|          | Lower                           | Upper          | Lower   | Upper                         | Lower   | Upper          |  |
| + 1      | +0.5 dB                         | +1.5 dB        | +1 dB   | +3 dB                         | +1.5 dB | +4.5 dB        |  |
| 0        | -0.5 dB                         | +0.5 dB        | -0.5 dB | +0.5 dB                       | -0.5 dB | +0.5 dB        |  |
| -1       | -0.5 dB                         | -1.5 dB        | -1 dB   | -3 dB                         | -1.5 dB | -4.5 dB        |  |

#### Table 6.4: Transmitter power control range

| TPC_ cmd<br>group | Transmitter<br>TPC_ cmd g     |        | al Transmitter power<br>control range after<br>equal TPC_ cmd g |        |          |        |
|-------------------|-------------------------------|--------|-----------------------------------------------------------------|--------|----------|--------|
| 5                 | 1 dB step size 2 dB step size |        |                                                                 | 3 dB s | tep size |        |
|                   | Lower                         | Upper  | Lower                                                           | Upper  | Lower    | Upper  |
| +1                | +8 dB                         | +12 dB | +16 dB                                                          | +24 dB | +16 dB   | +26 dB |
| 0                 | -1 dB                         | +1 dB  | -1 dB                                                           | +1 dB  | -1 dB    | +1 dB  |
| -1                | -8 dB                         | -12 dB | -16 dB                                                          | -24 dB | -16 dB   | -26 dB |
| 0,0,0,0,+1        | +6 dB                         | +14 dB | N/A                                                             | N/A    | N/A      | N/A    |
| 0,0,0,0,-1        | -6 dB                         | -14 dB | N/A                                                             | N/A    | N/A      | N/A    |

| Table 6.5: Trai | nsmitter aggre | egate power o | control range |
|-----------------|----------------|---------------|---------------|
|-----------------|----------------|---------------|---------------|

The UE shall meet the above requirements for inner loop power control over the power range bounded by the Minimum output power as defined in subclause 6.4.3, and the Maximum output power supported by the UE (i.e. the actual power as would be measured assuming no measurement error). This power shall be in the range specified for the power class of the UE in subclause 6.2.1.

#### 6.4.2.1.1A Additional requirement for DC-HSUPA

The UE transmitter shall have the capability of changing the output power in each assigned carrier in the uplink with a step size of 1, 2 and 3 dB according to the value of  $\Delta_{TPC}$  or  $\Delta_{RP-TPC}$ , in the slot immediately after the TPC\_cmd for the corresponding carrier as follows

- a) The transmitter output power step due to inner loop power control in each assigned carrier in the uplink shall be within the range shown in Table 6.4, when the total transmit power in each of the assigned carriers is equal to each other.
- b) The transmitter average output power step due to inner loop power control in each assigned carrier in the uplink shall be within the range shown in Table 6.5, when the total transmit power in each of the assigned carriers is equal to each other. Here a TPC\_cmd group is a set of TPC\_cmd values derived from a corresponding sequence of TPC commands of the same duration.
- c) The requirements can be tested by sending the same TPC commands for each of the assigned carriers, assuming that the signal powers for the carriers (in terms of DPCCH code power and total power) have been aligned prior to the beginning of the test procedure.

The inner loop power step is defined as the relative power difference between the mean power of the original (reference) timeslot and the mean power of the target timeslot in each carrier, not including the transient duration. The transient duration is from 25µs before the slot boundary to 25µs after the slot boundary.

## 6.4.2.1.1B Additional requirement for UL OLTD

For the UE with two active transmit antenna connectors in UL OLTD operation, the inner loop power control in the uplink specified in sub-clause 6.4.2.1.1 applies at each transmit antenna connector.

## 6.4.2.1.1C Additional requirement for UL CLTD

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the inner loop power control in the uplink specified in sub-clause 6.4.2.1.1 applies at each transmit antenna connector.

For UE configured in UL CLTD activation state 2 or activation state 3, the inner loop power control in the uplink specified in sub-clause 6.4.2.1.1 applies at the active transmit antenna connector.

#### 6.4.2.1.1D Additional requirement for UL MIMO

For UE with two active transmit antenna connectors in UL MIMO operation, the inner loop power control in the uplink specified in sub-clause 6.4.2.1.1 applies at each transmit antenna connector.

## 6.4.3 Minimum output power

The minimum controlled output power of the UE is when the power is set to a minimum value.

## 6.4.3.1 Minimum requirement

The minimum output power is defined as the mean power in one time slot. The minimum output power shall be less than -50 dBm.

## 6.4.3.1A Additional requirement for DC-HSUPA

The minimum output power is defined as the mean power in one time slot in each carrier. The minimum output power in each carrier shall be less than -50 dBm, when both carriers are set to minimum output power.

## 6.4.3.1B Additional requirement for UL OLTD

For the UE with two active transmit antenna connectors in UL OLTD operation, the minimum output power specified in sub-clause 6.4.3.1 applies at each transmit antenna connector, when the UE power is set to a minimum value.

## 6.4.3.1C Additional requirement for UL CLTD

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the minimum output power specified in sub-clause 6.4.3.1 applies at each transmit antenna connector, when the UE power is set to a minimum value.

For UE configured in UL CLTD activation state 2 or activation state 3, the minimum output power specified in subclause 6.4.3.1 applies at the active transmit antenna connector, when the UE power is set to a minimum value.

## 6.4.3.1D Additional requirement for UL MIMO

For UE with two active transmit antenna connectors in UL MIMO operation, the minimum output power specified in sub-clause 6.4.3.1 applies at each transmit antenna connector, when the UE power is set to a minimum value.

## 6.4.4 Out-of-synchronization handling of output power

The receiver characteristics in this section are specified at the antenna connector of the UE. For UE(s) with an integral antenna only, a reference antenna with a gain of 0 dBi is assumed. UE with an integral antenna may be taken into account by converting these power levels into field strength requirements, assuming a 0 dBi gain antenna. For UEs with more than one receiver antenna connector the AWGN signals applied to each receiver antenna connector shall be uncorrelated. The levels of the test signal applied to each of the antenna connectors shall be as defined in section 6.4.4.2 below.

The UE shall monitor the DPCCH quality in order to detect a loss of the signal on Layer 1, as specified in TS 25.214. The thresholds  $Q_{out}$  and  $Q_{in}$  specify at what DPCCH quality levels the UE shall shut its power off and when it shall turn its power on respectively. The thresholds are not defined explicitly, but are defined by the conditions under which the UE shall shut its transmitter off and turn it on, as stated in this subclause.

The DPCCH quality shall be monitored in the UE and compared to the thresholds  $Q_{out}$  and  $Q_{in}$  for the purpose of monitoring synchronization. The threshold  $Q_{out}$  should correspond to a level of DPCCH quality where no reliable detection of the TPC commands transmitted on the downlink DPCCH can be made. This can be at a TPC command error ratio level of e.g. 30%. The threshold  $Q_{in}$  should correspond to a level of DPCCH quality where detection of the TPC commands transmitted on the downlink DPCCH is significantly more reliable than at  $Q_{out}$ . This can be at a TPC command error ratio level of e.g. 20%.

## 6.4.4.1 Minimum requirement

When the UE estimates the DPCCH quality or the quality of the TPC fields of the F-DPCH frame received from the serving HS-DSCH cell over the last 160 ms period or quality of the TPC fields of the F-DPCH from the serving HS-DSCH cell over the previous 240 slots in which the TPC symbols are known to be present when the discontinuous uplink DPCCH transmission operation is enabled to be worse than a threshold Q<sub>out</sub>, the UE shall shut its transmitter off

within 40 ms. The UE shall not turn its transmitter on again until the DPCCH quality exceeds an acceptable level  $Q_{in}$ . When the UE estimates the DPCCH quality or the quality of the TPC fields of the F-DPCH frame received from the serving HS-DSCH cell over the last 160 ms period or quality of the TPC fields of the F-DPCH from the serving HS-DSCH cell over the previous 240 slots in which the TPC symbols are known to be present when the discontinuous uplink DPCCH transmission operation is enabled to be better than a threshold  $Q_{in}$ , the UE shall again turn its transmitter on within 40 ms.

The UE transmitter shall be considered "off" if the transmitted power is below the level defined in subclause 6.5.1 (Transmit off power). Otherwise the transmitter shall be considered as "on".

## 6.4.4.1A Additional requirement for UL OLTD

For UE with two active transmit antenna connectors in UL OLTD operation, the minimum requirements specified in sub-clause 6.4.4.1 apply at each transmit antenna connector.

## 6.4.4.1B Additional requirement for UL CLTD

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the minimum requirements specified in sub-clause 6.4.4.1 apply at each transmit antenna connector.

For UE configured in UL CLTD activation state 2 or activation state 3, the minimum requirements specified in subclause 6.4.4.1 apply at the active transmit antenna connector.

## 6.4.4.1C Additional requirement for UL MIMO

For UE with two active transmit antenna connectors in UL MIMO operation, the minimum requirements specified in sub-clause 6.4.4.1 apply at each transmit antenna connector.

## 6.4.4.2 Test case

This subclause specifies a test case, which provides additional information for how the minimum requirement should be interpreted for the purpose of conformance testing.

The quality levels at the thresholds  $Q_{out}$  and  $Q_{in}$  correspond to different signal levels depending on the downlink conditions DCH parameters. For the conditions in Table 6.6, a signal with the quality at the level  $Q_{out}$  can be generated by a DPCCH\_Ec/Ior ratio of -25 dB, and a signal with  $Q_{in}$  by a DPCCH\_Ec/Ior ratio of -21 dB. For a UE which supports the optional enhanced performance requirements type1 for DCH a signal with the quality at the level  $Q_{out}$  can be instead generated by a DPCCH\_Ec/Ior ratio of -28 dB, and a signal with  $Q_{in}$  by a DPCCH\_Ec/Ior ratio of -24 dB for the conditions in Table 6.6. The DL reference measurement channel (12.2) kbps specified in subclause A.3.1 and with static propagation conditions. The downlink physical channels, other than those specified in Table 6.6, are as specified in Table C.3 of Annex C.

Figure 6.1 shows an example scenario where the DPCCH\_Ec/Ior ratio varies from a level where the DPCH is demodulated under normal conditions, down to a level below  $Q_{out}$  where the UE shall shut its power off and then back up to a level above  $Q_{in}$  where the UE shall turn the power back on. Figure 6.1A shows an example scenario for a UE which supports the optional enhanced performance requirements type1 for DCH, where the DPCCH\_Ec/Ior ratio varies from a level where the DPCH is demodulated under normal conditions, down to a level below  $Q_{out}$  where the UE shall shut its power off and then back up to a level above  $Q_{in}$  where the UE shall turn the power back on.

| Parameter                   | Unit         | Value                                                             |
|-----------------------------|--------------|-------------------------------------------------------------------|
| $\hat{I}_{or}/I_{oc}$       | dB           | -1                                                                |

Table 6.6: DCH parameters for the Out-of-synch handling test case

Figure 6.1: Test case for out-of-synch handling in the UE

# Figure 6.1A: Test case for out-of-synch handling in the UE supporting the enhanced performance requirements type1

In this test case, the requirements for the UE are that:

- 1. The UE shall not shut its transmitter off before point B.
- 2. The UE shall shut its transmitter off before point C, which is  $T_{off} = 200$  ms after point B.
- 3. The UE shall not turn its transmitter on between points C and E.
- 4. The UE shall turn its transmitter on before point F, which is  $T_{on} = 200$  ms after point E.

# 6.4A Output pattern dynamics

An F-TPICH carries transmitted precoding indicator generated at layer 1 for UL CLTD operation.

## 6.4A.1 Out-of-quality handling of TPI applicability

The UE shall measure the reliability of the received TPI bits over the 3 slot period in which the TPI bit pattern corresponding to a precoding weight is received, as specified in TS 25.214 [8]. The received TPI bits are mapped to precoding weights and applied by the UE only if the estimated quality of the TPI bits is determined to be better than a threshold  $Q_{tpi}$ . Otherwise, the UE shall apply the precoding weights corresponding to the last reliably received TPI bit pattern. The threshold is not defined explicitly, but is defined by the conditions under which the UE shall apply the precoding weights corresponding to the received TPI bits and apply the precoding weights corresponding to the received TPI bits and apply the precoding weights corresponding to the last reliably received TPI bits and apply the precoding weights corresponding to the last reliably received TPI bits and apply the precoding weights corresponding to the last reliably received TPI bits and apply the precoding weights corresponding to the last reliably received TPI bits and apply the precoding weights corresponding to the last reliably received TPI bits and apply the precoding weights corresponding to the last reliably received TPI bits and apply the precoding weights corresponding to the last reliably received TPI bits, as stated in this subclause.

The threshold  $Q_{tpi}$  should correspond to a level of F-TPICH quality below which no reliable detection of the TPI bits transmitted on the downlink DPCCH can be made.

#### 6.4A.1.1 Minimum requirement

When the UE estimates the F-TPICH quality received over the 3 slot period to be worse than a threshold  $Q_{tpi}$ , the UE shall apply the precoding weights corresponding to the last reliably received TPI bit pattern. The UE shall not apply the precoding weights corresponding to the received TPI bits again until the F-TPICH quality exceeds a threshold  $Q_{tpi}$ .

When the estimated F-TPICH qualtity is better than a threshold  $Q_{tpi}$ , the UE shall again apply the precoding weights corresponding to the received TPI bits.

## 6.4A.1.2 Test case

This subclause specifies a test case, which provides additional information for how the minimum requirement should be interpreted for the purpose of conformance testing.

The quality level at the threshold  $Q_{tpi}$  corresponds to a signal level depending on the downlink conditions F-TPICH parameters. For the conditions in Table 6.6A, a signal with the quality below the level  $Q_{tpi}$  can be generated by an F-TPICH\_Ec/Ior ratio of -26 dB, and a signal with the quality above the level  $Q_{tpi}$  can be generated by an F-TPICH\_Ec/Ior ratio of -12 dB. For a UE which supports the optional enhanced requirements type1 specified based on receiver diversity for F-TPICH a signal with the quality below the level  $Q_{tpi}$  can be instead generated by an F-TPICH\_Ec/Ior ratio of -29 dB for the conditions in Table 6.6A, and a signal with the quality above the level  $Q_{tpi}$  by an F-TPICH\_Ec/Ior ratio of -15 dB. The downlink physical channels, other than those specified in Table 6.6A, are as specified in Table C.3 of Annex C.

Figure 6.1B shows an example scenario where the F-TPICH\_Ec/Ior ratio varies from a level where the F-TPICH is demodulated under normal conditions, down to a level below  $Q_{tpi}$  where the UE shall apply the precoding weights corresponding to the last reliably received TPI bit pattern and then back up to a level above  $Q_{tpi}$  where the UE shall apply the precoding weights corresponding to the received TPI bit pattern. Figure 6.1C shows an example scenario for a UE which supports the optional enhanced requirements type1 for F-TPICH, where the F-TPICH\_Ec/Ior ratio varies from a level where the F-TPICH is demodulated under normal conditions, down to a level below  $Q_{tpi}$  where the UE shall apply the precoding weights corresponding to the last reliably received TPI bit pattern and then back up to a level below  $Q_{tpi}$  where the UE shall apply the precoding weights corresponding to the last reliably received TPI bit pattern. Figure 6.1C shows an example scenario for a level where the F-TPICH is demodulated under normal conditions, down to a level below  $Q_{tpi}$  where the UE shall apply the precoding weights corresponding to the last reliably received TPI bit pattern and then back up to a level above  $Q_{tpi}$  where the UE shall apply the precoding weights corresponding to the received TPI bit pattern. Point B shall be at least 10 ms after point A, and point D shall be at least 10 ms after point C.

For a UE which supports the optional enhanced requirements type 1 for F-TPICH, the UE shall not be tested according to the minimum requirements.

| Parameter                     | Unit         | Value                          |
|-------------------------------|--------------|--------------------------------|
| Propagation condition         |              | Static                         |
| $\hat{I}_{or}/I_{oc}$         | dB           | -1                             |
| I <sub>oc</sub>               | dBm/3.84 MHz | -60                            |
| $\frac{F-TPICH\_E_c}{I_{or}}$ | dB           | See figure 6.1B or figure 6.1C |

Table 6.6A: parameters for the out-of-quality handling of F-TPICH test case

Figure 6.1B: Test case for F-TPICH out-of-quality handling in the UE supporting the minimum requirements for F-TPICH

Figure 6.1C: Test case for F-TPICH out-of-quality handling in the UE supporting the optional enhanced requirements type1 for F-TPICH

In these test cases, the requirements for the UE are that:

- 1. The UE shall keep precoding weights with more than 50% of the time between point B and point C.
- 2. The UE apply precoding weights w.r.t. TPI bits with more than 99% of the time after point D.

# 6.5 Transmit ON/OFF power

## 6.5.1 Transmit OFF power

Transmit OFF power is defined as the RRC filtered mean power when the transmitter is off. The transmitter is considered to be off when the UE is not allowed to transmit or during periods when the UE is not transmitting DPCCH due to discontinuous uplink DPCCH transmission. During UL compressed mode gaps, the UE is not considered to be off.

#### 6.5.1.1 Minimum requirement

The transmit OFF power is defined as the RRC filtered mean power in a duration of at least one timeslot excluding any transient periods. The requirement for the transmit OFF power shall be less than -56 dBm.

## 6.5.1.1A Additional requirement for DC-HSUPA

The transmit OFF power is defined per carrier as the RRC filtered mean power in a duration of at least one timeslot excluding any transient periods. The requirement for the transmit OFF power in each carrier shall be less than -56 dBm, when the transmitters in both carriers are turned off.

## 6.5.1.1B Additional requirement for UL OLTD

For the UE with two active transmit antenna connectors in UL OLTD operation, the transmit OFF power specified in sub-clause 6.5.1.1 applies at each transmit antenna connector, when the transmitter is OFF on both transmit connectors.

## 6.5.1.1C Additional requirement for UL CLTD

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the transmit OFF power specified in sub-clause 6.5.1.1 applies at each transmit antenna connector, when the transmitter is OFF on both transmit antenna connectors.

For UE configured in UL CLTD activation state 2 or activation state 3, the transmit OFF power specified in sub-clause 6.5.1.1 applies at the active transmit antenna connector, when the transmitter is OFF on both transmit antenna connectors.

## 6.5.1.1D Additional requirement for UL MIMO

For UE with two active transmit antenna connectors in UL MIMO operation, the transmit OFF power specified in subclause 6.5.1.1 applies at each transmit antenna connector, when the transmitter is OFF on both transmit antenna connectors.

## 6.5.2 Transmit ON/OFF Time mask

The time mask for transmit ON/OFF defines the transient period allowed for the UE between transmit OFF power and transmit ON power. During the transient period there are no additional requirements on UE transmit power beyond what is required in subclause 6.2 maximum output power observed over a period of at least one timeslot. ON/OFF scenarios include PRACH preamble bursts, the beginning or end of PRACH message parts, the beginning or end of each discontinuous uplink DPCCH transmission gap and the beginning or end of UL DPCH transmissions.

## 6.5.2.1 Minimum requirement

The transmit power levels versus time shall meet the requirements in figure 6.2 for PRACH preambles, the requirements in figure 6.2A for discontinuous uplink DPCCH transmission and the requirements in figure 6.3 for all other cases. The off power observation period is defined as the RRC filtered mean power in a duration of at least one timeslot excluding any transient periods. The on power observation period is defined as the mean power over one timeslot excluding any transient periods. For PRACH preambles, the on power observation period is 3904 chips (4096 chips less the transient periods).

The off power specification in figures 6.2 and 6.3 is as defined in 6.5.1.1.

The average on power specification in figures 6.2 and 6.3 depends on each possible case.

- First preamble of RACH: Open loop accuracy (Table 6.3).
- During preamble ramping of the RACH, and between final RACH preamble and RACH message part: Accuracy depending on size of the required power difference (Table 6.7). The step in total transmitted power between final RACH preamble and RACH message (control part + data part) shall be rounded to the closest integer dB value. A power step exactly half-way between two integer values shall be rounded to the closest integer of greater magnitude.
- After transmission gaps due to discontinuous uplink DPCCH transmission: Accuracy as defined in Table 6.7A. The uplink transmitter power difference tolerance after a transmission gap of up to 10 sub-frames shall be within the range as defined in Table 6.7A. The TPC\_cmd value shown in Table 6.7A corresponds to the last TPC\_cmd value received before the transmission gap and applied by the UE after the transmission gap when discontinuous uplink DPCCH transmission is activated.
- After transmission gaps in compressed mode: Accuracy as in Table 6.9.
- Power step to Maximum Power: Maximum power accuracy (Table 6.1).

| -1           | -4 dB                                                                             | +2 dB                                        | -5 dB | +1 dB | -6 dB | 0 dB     |

## 6.5.2.1A Additional requirement for UL OLTD

For UE with two active transmit antenna connectors in UL OLTD operation, the minimum requirements except the requirement with PRACH specified in sub-clause 6.5.2.1 apply at each transmit antenna connector.

## 6.5.2.1B Additional requirement for UL CLTD

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the minimum requirements specified in sub-clause 6.5.2.1 except the requirement with PRACH apply at each transmit antenna connector.

For UE configured in UL CLTD activation state 2 or activation state 3, the minimum requirements in sub-clause 6.5.2.1 except the requirement with PRACH apply at the active transmit antenna connector.

## 6.5.2.1C Additional requirement for UL MIMO

For UE with two active transmit antenna connectors in UL MIMO operation, the minimum requirements specified in sub-clause 6.5.2.1, except the requirement with PRACH, apply at each transmit antenna connector.

## 6.5.3 Change of TFC

A change of TFC (Transport Format Combination) in uplink means that the power in the uplink varies according to the change in data rate. DTX, where the DPDCH is turned off, is a special case of variable data, which is used to minimise the interference between UE(s) by reducing the UE transmit power when voice, user or control information is not present.

#### 6.5.3.1 Minimum requirement

A change of output power is required when the TFC, and thereby the data rate, is changed. The ratio of the amplitude between the DPDCH codes and the DPCCH code will vary. The power step due to a change in TFC shall be calculated in the UE so that the power transmitted on the DPCCH shall follow the inner loop power control. The step in total transmitted power (DPCCH + DPDCH) shall then be rounded to the closest integer dB value. A power step exactly half-way between two integer values shall be rounded to the closest integer of greater magnitude. The accuracy of the

power step, given the step size, is specified in Table 6.8. The power change due to a change in TFC is defined as the relative power difference between the mean power of the original (reference) timeslot and the mean power of the target timeslot, not including the transient duration. The transient duration is from  $25\mu$ s before the slot boundary to  $25\mu$ s after the slot boundary.

| Power step size (Up or down)<br>∆P [dB] | Transmitter power step<br>tolerance [dB] |
|-----------------------------------------|------------------------------------------|
| 0                                       | +/- 0.5                                  |
| 1                                       | +/- 0.5                                  |
| 2                                       | +/- 1.0                                  |
| 3                                       | +/- 1.5                                  |
| 4 ≤□ Δ P ≤10                            | +/- 2.0                                  |
| 11 ≤□ Δ P ≤15                           | +/- 3.0                                  |
| 16 ≤□ Δ P ≤20                           | +/- 4.0                                  |
| 21 ≤□ Δ P                               | +/- 6.0                                  |

The mean power of successive slots shall be calculated according to Figure 6.4.

Figure 6.4: Transmit template during TFC change

## 6.5.3.1A Additional requirement for UL OLTD

For UE with two active transmit antenna connectors in UL OLTD operation, the minimum requirements specified in sub-clause 6.5.3.1 apply at each transmit antenna connector.

## 6.5.3.1B Additional requirement for UL CLTD

A change of output power is required when the TFC, and thereby the data rate, is changed. The ratio of the amplitude between the DPDCH codes and the DPCCH code will vary. The power step due to a change in TFC shall be calculated in the UE so that the power transmitted on the DPCCH shall follow the inner loop power control. The step in total transmitted power (DPCCH + S-DPCCH + DPDCH for UE configured in UL CLTD activation state 1, and DPCCH + DPDCH for UE configured in UL CLTD activation state 2 or activation state 3) shall then be rounded to the closest integer dB value. A power step exactly half-way between two integer values shall be rounded to the closest integer of greater magnitude. The accuracy of the power step, given the step size, is specified in Table 6.8 at each transmit antenna connector. The power change at each transmit antenna connector due to a change in TFC is defined as the relative power difference between the mean power of the original (reference) timeslot and the mean power of the target timeslot, not including the transient duration. The transient duration is from 25µs before the slot boundary to 25µs after the slot boundary.

## 6.5.4 Power setting in uplink compressed mode

Compressed mode in uplink means that the power in uplink is changed.

## 6.5.4.1 Minimum requirement

A change of output power is required during uplink compressed frames since the transmission of data is performed in a shorter interval. The ratio of the amplitude between the DPDCH codes and the DPCCH code will also vary. The power step due to compressed mode shall be calculated in the UE so that the energy transmitted on the pilot bits during each transmitted slot shall follow the inner loop power control.

Thereby, the power during compressed mode, and immediately afterwards, shall be such that the mean power of the DPCCH follows the steps due to inner loop power control combined with additional steps of  $10Log_{10}(N_{pilot.prev} / N_{pilot.curr})$  dB where  $N_{pilot.prev}$  is the number of pilot bits in the previously transmitted slot, and  $N_{pilot.curr}$  is the current number of pilot bits per slot.

The resulting step in total transmitted power (DPCCH +DPDCH) shall then be rounded to the closest integer dB value. A power step exactly half-way between two integer values shall be rounded to the closest integer of greatest magnitude. The accuracy of the power step, given the step size, is specified in Table 6.8 in subclause 6.5.3.1. The power step is defined as the relative power difference between the mean power of the original (reference) timeslot and the mean power of the target timeslot, when neither the original timeslot nor the reference timeslot are in a transmission gap. The transient duration is not included, and is from  $25\mu$ s before the slot boundary to  $25\mu$ s after the slot boundary.

In addition to any power change due to the ratio  $N_{pilot,prev} / N_{pilot,curr}$ , the mean power of the DPCCH in the first slot after a compressed mode transmission gap shall differ from the mean power of the DPCCH in the last slot before the transmission gap by an amount  $\Delta_{RESUME}$ , where  $\Delta_{RESUME}$  is calculated as described in clause 5.1.2.3 of TS 25.214.

The resulting difference in the total transmitted power (DPCCH + DPDCH) shall then be rounded to the closest integer dB value. A power difference exactly half-way between two integer values shall be rounded to the closest integer of greatest magnitude. The accuracy of the resulting difference in the total transmitted power (DPCCH + DPDCH) after a transmission gap of up to 14 slots shall be as specified in Table 6.9.

| Power difference (Up or down)<br>∆P [dB] | Transmitter power step<br>tolerance after a transmission<br>gap [dB] |
|------------------------------------------|----------------------------------------------------------------------|
| $\Delta P \leq 2$                        | +/- 3                                                                |
| 3                                        | +/- 3                                                                |
| 4 ≤□ Δ P ≤10                             | +/- 3.5                                                              |
| 11 ≤□ Δ P ≤15                            | +/- 4                                                                |
| 16 ≤□ Δ P ≤20                            | +/- 4.5                                                              |
| 21 ≤□ Δ P                                | +/- 6.5                                                              |

Table 6.9: Transmitter power difference tolerance after a transmission gap of up to 14 slots

The power difference is defined as the difference between the mean power of the original (reference) timeslot before the transmission gap and the mean power of the target timeslot after the transmission gap, not including the transient durations. The transient durations at the start and end of the transmission gaps are each from  $25\mu s$  before the slot boundary to  $25\mu s$  after the slot boundary.

The mean power of successive slots shall be calculated according to figure 6.5.

Figure 6.5: Transmit template during compressed mode

## 6.5.4.1A Additional requirement for UL OLTD

For UE with two active transmit antenna connectors in UL OLTD operation, the minimum requirements specified in sub-clause 6.5.4.1 apply at each UE antenna connector.

## 6.5.4.1B Additional requirement for UL CLTD

A change of output power is required during uplink compressed frames since the transmission of data is performed in a shorter interval. The ratio of the amplitude between the DPDCH codes and the DPCCH code will also vary. The power step due to compressed mode shall be calculated in the UE so that the energy transmitted on the pilot bits during each transmitted slot shall follow the inner loop power control.

Thereby, the power during compressed mode, and immediately afterwards, shall be such that the mean power of the DPCCH follows the steps due to inner loop power control combined with additional steps of  $10Log_{10}(N_{pilot.prev} / N_{pilot.curr})$  dB where  $N_{pilot.prev}$  is the number of pilot bits in the previously transmitted slot, and  $N_{pilot.curr}$  is the current number of pilot bits per slot.

The resulting step in total transmitted power (DPCCH + S-DPCCH +DPDCH for UE configured in UL CLTD activation state 1, and DPCCH + DPDCH for UE configured in UL CLTD activation state 2 or activation state 3) shall then be rounded to the closest integer dB value. A power step exactly half-way between two integer values shall be rounded to the closest integer of greatest magnitude. The accuracy of the power step at each transmit antenna connector, given the step size, is specified in Table 6.8 in subclause 6.5.3.1. The power step is defined as the relative power difference between the mean power of the original (reference) timeslot and the mean power of the target timeslot, when neither the original timeslot nor the reference timeslot are in a transmission gap. The transient duration is not included, and is from 25µs before the slot boundary to 25µs after the slot boundary.

In addition to any power change due to the ratio  $N_{pilot,prev} / N_{pilot,curr}$ , the mean power of the DPCCH in the first slot after a compressed mode transmission gap shall differ from the mean power of the DPCCH in the last slot before the transmission gap by an amount  $\Delta_{RESUME}$ , where  $\Delta_{RESUME}$  is calculated as described in clause 5.1.2.3 of TS 25.214.

The resulting difference in the total transmitted power (DPCCH + S-DPCCH + DPDCH for UE configured in UL CLTD activation state 1, and DPCCH + DPDCH for UE configured in UL CLTD activation state 2 or activation state 3) shall then be rounded to the closest integer dB value. A power difference exactly half-way between two integer values shall be rounded to the closest integer of greatest magnitude. The accuracy of the resulting difference in the total transmitted power (DPCCH + S-DPCCH + DPDCH for UE configured in UL CLTD activation state 1, and DPCCH + DPDCH for UE configured in UL CLTD activation state 1, and DPCCH + DPDCH for UE configured in UL CLTD activation state 1, and DPCCH + DPDCH for UE configured in UL CLTD activation state 2 or activation state 3) after a transmission gap of up to 14 slots shall be as specified in Table 6.9 at each transmit antenna connector.

The power difference at each transmit antenna connector is defined as the difference between the mean power of the original (reference) timeslot before the transmission gap and the mean power of the target timeslot after the transmission gap, not including the transient durations. The transient durations at the start and end of the transmission gaps are each from 25µs before the slot boundary to 25µs after the slot boundary. The mean power of successive slots shall be calculated according to figure 6.5.

## 6.5.5 HS-DPCCH

The transmission of Ack/Nack or CQI over the HS-DPCCH may cause the transmission power in the uplink to vary. The ratio of the amplitude between the DPCCH and the Ack/Nack and CQI respectively is signalled by higher layers.

## 6.5.5.1 Minimum requirement

The nominal sum power on DPCCH+DPDCH is independent of the transmission of Ack/Nack and CQI unless the UE output power when Ack/Nack or CQI is transmitted would exceed the maximum value specified in Table 6.1A or fall below the value specified in 6.4.3.1, whereupon the UE shall apply additional scaling to the total transmit power as defined in section 5.1.2.6 of TS.25.214 [8].

The composite transmitted power (DPCCH + DPDCH+HS-DPCCH) may then also be rounded to the closest integer dB value. If rounding is done a power step exactly half-way between two integer values shall be rounded to the closest integer of greater magnitude.

The nominal power step due to transmission of Ack/Nack or CQI is defined as the difference between the nominal mean powers of two power evaluation periods either side of an HS-DPCCH boundary. The first evaluation period starts  $25\mu s$ 

after a DPCCH slot boundary and ends 25µs before the following HS-DPCCH slot boundary. The second evaluation period starts 25µs after the same HS-DPCCH slot boundary and ends 25µs before the following DPCCH slot boundary. This is described graphically in figure 6.6.

The power step due to HS-DPCCH transmission is the difference between the mean powers transmitted before and after an HS-DPCCH slot boundary. The mean power evaluation period excludes a 25µs period before and after any DPCCH or HS-DPCCH slot boundary.

#### Figure 6.6: Transmit power template during HS-DPCCH transmission

The tolerance of the power step due to transmission of the HS-DPCCH shall meet the requirements in table 6.9A.

| Nominal power step size (Up or down) ∆P [dB] | Transmitter power step<br>tolerance [dB] |
|----------------------------------------------|------------------------------------------|
| 0                                            | +/- 0.5                                  |
| 1                                            | +/- 0.5                                  |
| 2                                            | +/- 1.0                                  |
| 3                                            | +/- 1.5                                  |
| 4 ≤□ Δ P ≤ 10                                | +/- 2.0                                  |
| $11 \le \Delta P \le 15$                     | +/- 3.0                                  |

#### Table 6.9A: Transmitter power step tolerance

## 6.5.5.1A Additional requirement for UL OLTD

For UE with two active transmit antenna connectors in UL OLTD operation, the minimum requirements specified in sub-clause 6.5.5.1 apply at each transmit antenna connector.

## 6.5.5.1B Additional requirement for UL CLTD

The nominal sum power on DPCCH+S-DPCCH+DPDCH is independent of the transmission of Ack/Nack and CQI unless the UE output power when Ack/Nack or CQI is transmitted would exceed the maximum value specified in Table

6.1A or fall below the value specified in 6.4.3.1, whereupon the UE shall apply additional scaling to the total transmit power as defined in section 5.1.2.6 of TS.25.214 [8].

The composite transmitted power (DPCCH + S-DPCCH + DPDCH+HS-DPCCH) may then also be rounded to the closest integer dB value. If rounding is done a power step exactly half-way between two integer values shall be rounded to the closest integer of greater magnitude.

The nominal power step due to transmission of Ack/Nack or CQI is defined as the difference between the nominal mean powers of two power evaluation periods either side of an HS-DPCCH boundary. The first evaluation period starts 25µs after a DPCCH slot boundary and ends 25µs before the following HS-DPCCH slot boundary. The second evaluation period starts 25µs after the same HS-DPCCH slot boundary and ends 25µs before the following DPCCH slot boundary.

The tolerance of the power step due to transmission of the HS-DPCCH shall meet the requirements in table 6.9A at each transmit antenna connector.

## 6.5.5.1C Additional requirement for UL MIMO

The nominal sum power on DPCCH+S-DPCCH+E-DPDCH+S-E-DPDCH+E-DPCCH+S-E-DPCCH is independent of the transmission of Ack/Nack and CQI unless the UE output power when Ack/Nack or CQI is transmitted would exceed the maximum value specified in Table 6.1AC or fall below the value specified in 6.4.3.1D, whereupon the UE shall apply additional scaling to the total transmit power as defined in section 5.1.2.6 of TS.25.214 [8].

The composite transmitted power (DPCCH + S-DPCCH + E-DPDCH + S-E-DPDCH + E-DPCCH + S-E-DPCCH + HS-DPCCH) may then also be rounded to the closest integer dB value. If rounding is done a power step exactly half-way between two integer values shall be rounded to the closest integer of greater magnitude.

The nominal power step due to transmission of Ack/Nack or CQI is defined as the difference between the nominal mean powers of two power evaluation periods either side of an HS-DPCCH boundary. The first evaluation period starts 25µs after a DPCCH slot boundary and ends 25µs before the following HS-DPCCH slot boundary. The second evaluation period starts 25µs after the same HS-DPCCH slot boundary and ends 25µs before the following DPCCH slot boundary.

The tolerance of the power step due to transmission of the HS-DPCCH shall meet the requirements in table 6.9A at each transmit antenna connector.

# 6.6 Output RF spectrum emissions

## 6.6.1 Occupied bandwidth

Occupied bandwidth is a measure of the bandwidth containing 99 % of the total integrated power of the transmitted spectrum, centered on the assigned channel frequency. The occupied channel bandwidth shall be less than 5 MHz based on a chip rate of 3.84 Mcps.

# 6.6.1A Occupied bandwidth for DC-HSUPA

In the case dual adjacent carriers are assigned in the uplink, occupied bandwidth is a measure of the bandwidth containing 99 % of the total integrated power of the transmitted spectrum, centered at the center of the assigned channel frequencies. The occupied channel bandwidth shall be less than 10 MHz on a chip rate of 3.84 Mcps.

# 6.6.1B Occupied bandwidth for UL OLTD

For UE with two active transmit antenna connectors in UL OLTD operation, occupied bandwidth requirement is defined per UE.

The occupied bandwidth of the UL OLTD UE is determined by the occupied bandwidth (defined in 6.6.1) measured at each active antenna port of the UE. The upper boundary of the UE occupied bandwidth is the highest boundary of the two measured occupied bandwidths. The lower boundary of the UE occupied bandwidth is the lowest boundary of the two measured occupied bandwidths. The occupied channel bandwidth for UE shall be less than 5 MHz based on a chip rate of 3.84 Mcps.

# 6.6.1C Occupied bandwidth for UL CLTD

For UE with two active transmit antenna connectors in UL CLTD activation state 1, occupied bandwidth requirement is defined per UE.

The occupied bandwidth of the UL CLTD UE is determined by the occupied bandwidth (defined in 6.6.1) measured at each active antenna port of the UE. The upper boundary of the UE occupied bandwidth is the highest boundary of the two measured occupied bandwidths. The lower boundary of the UE occupied bandwidth is the lowest boundary of the two measured occupied bandwidths. The occupied channel bandwidth for UE shall be less than 5 MHz based on a chip rate of 3.84 Mcps.

For UE configured in UL CLTD activation state 2 or activation state 3, the requirement in sub-clause 6.6.1 apply at the active transmit antenna connector.

# 6.6.1D Occupied bandwidth for UL MIMO

For UE with two active transmit antenna connectors in UL MIMO operation, occupied bandwidth requirement is defined per UE.

The occupied bandwidth of the UL MIMO UE is determined by the occupied bandwidth (defined in 6.6.1) measured at each active antenna connector of the UE. The upper boundary of the UE occupied bandwidth is the higher upper boundary of the two measured occupied bandwidths. The lower boundary of the UE occupied bandwidth is the lower low boundary of the two measured occupied bandwidths. The occupied channel bandwidth for UE shall be less than 5 MHz based on a chip rate of 3.84 Mcps.

## 6.6.2 Out of band emission

Out of band emissions are unwanted emissions immediately outside the nominal channel resulting from the modulation process and non-linearity in the transmitter but excluding spurious emissions. This out of band emission limit is specified in terms of a spectrum emission mask and Adjacent Channel Leakage power Ratio.

## 6.6.2.1 Spectrum emission mask

The spectrum emission mask of the UE applies to frequencies, which are between 2.5 MHz and 12.5 MHz away from the UE centre carrier frequency. The out of channel emission is specified relative to the RRC filtered mean power of the UE carrier.

## 6.6.2.1.1 Minimum requirement

The power of any UE emission shall not exceed the levels specified in Table 6.10. The absolute requirement is based on a -50 dBm/3.84 MHz minimum power threshold for the UE. This limit is expressed for the narrower measurement bandwidths as -55.8 dBm/1 MHz and -71.1 dBm/30 kHz. The requirements are applicable for all values of  $\beta_c$ ,  $\beta_d$ ,  $\beta_{hs}$ ,  $\beta_{ec}$  and  $\beta_{ed}$  as specified in [8].

| Δf in MHz                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Minimum requirement (Note 2)                                                |                         | Measurement<br>bandwidth |  |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------|-------------------------|--------------------------|--|
| (Note 1)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Relative requirement                                                        | Absolute<br>requirement | bandwidth                |  |
| 2.5 - 3.5                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | $\left\{-35 - 15 \cdot \left(\frac{\Delta f}{MHz} - 2.5\right)\right\} dBc$ | -71.1 dBm               | 30 kHz<br>(Note 3)       |  |
| 3.5 - 7.5                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | $\left\{-35 - 1 \cdot \left(\frac{\Delta f}{MHz} - 3.5\right)\right\} dBc$  | -55.8 dBm               | 1 MHz<br>(Note 4)        |  |

| 8.5 - 12.5 MHz                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | -49 dBc                                                                     | -55.8 dBm               | 1 MHz<br>(Note 4)        |  |
| Note 1:       Δf is the separation between the carrier frequency and the centre of the measurement bandwidth.         Note 2:       The minimum requirement is calculated from the relative requirement or the absolute requirement, whichever is the higher power.         Note 3:       The first and last measurement position with a 30 kHz filter is at Δf equals to 2.515 MHz and 3.485 MHz.         Note 4:       The first and last measurement position with a 1 MHz filter is at Δf equals to 4 MHz and 12 MHz. |                                                                             |                         |                          |  |

#### Table 6.10: Spectrum Emission Mask Requirement

For operation in band II, IV, V, X, XII, XIII, XIV, XXV and XXVI the minimum requirement is calculated from the minimum requirement in table 6.10 or the applicable additional requirement in Tables 6.10A, 6.10B or 6.10C, whichever is the tighter requirement.

Table 6.10A: Additional spectrum emission limits for Bands II, IV, X and XXV

| Note 1: $\Delta f$ is the separation between the carrier frequency and the centre of the measurement bandwidth. |                                                                         |                                                   |                          |

Table 6.10C: Additional spectrum emission limits for Bands XII, XIII, XIV

NOTE: As a general rule, the resolution bandwidth of the measuring equipment should be equal to the measurement bandwidth specified in tables 6.10, 6.10A, 6.10B and 6.10C. However, to improve measurement accuracy, sensitivity and efficiency, the resolution bandwidth may be smaller than the measurement bandwidth. When the resolution bandwidth is smaller than the measurement bandwidth, the result should be integrated over the measurement bandwidth in order to obtain the equivalent noise bandwidth of the measurement bandwidth.

## 6.6.2.1A Additional Spectrum emission mask for DC-HSUPA

The spectrum emission mask of the UE applies to frequencies, which are between 5 MHz and 20 MHz away from the UE centre frequency of the two assigned channel frequencies. The requirements assume that the UE output power shall be maximum level. The reference measurement channels for the requirements in subclause 6.6.2.1A.1 and 6.6.2.1A.2 are provided in subclause A.2.8.

#### 6.6.2.1A.1 Minimum requirement

The power of any UE emission shall not exceed the levels specified in Table 6.10D for the specified channel bandwidth.

| Δf<br>(MHz)                                       | Frequency offset of<br>measurement filter centre<br>frequency, f_offset | Spectrum emission<br>limit (dBm) | Measurement<br>bandwidth |

## 6.6.2.1B Additional requirement for UL OLTD

For UE with two active transmit antenna connectors in UL OLTD operation, the spectrum emission mask specified in sub-clause 6.6.2.1 applies at each transmit antenna connector.

## 6.6.2.1C Additional requirement for UL CLTD

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the spectrum emission mask specified in sub-clause 6.6.2.1 applies at each transmit antenna connector.

For UE configured in UL CLTD activation state 2 or activation state 3, the requirements in sub-clause 6.6.2.1 apply at the active transmit antenna connector.

## 6.6.2.1D Additional requirement for UL MIMO

For UE with two active transmit antenna connectors in UL MIMO operation, the spectrum emission mask specified in sub-clause 6.6.2.1 applies at each transmit antenna connector.

## 6.6.2.2 Adjacent Channel Leakage power Ratio (ACLR)

In the case a single carrier is assigned on the uplink, Adjacent Channel Leakage power Ratio (ACLR) is the ratio of the RRC filtered mean power centered on the assigned channel frequency to the RRC filtered mean power centered on an adjacent channel frequency.

In the case dual adjacent carriers are assigned on the uplink, ACLR is the ratio of the sum of the RRC filtered mean powers centered on each of the two assigned channel frequencies to the RRC filtered mean power centered on an adjacent channel frequency.

#### 6.6.2.2.1 Minimum requirement

If the adjacent channel power is greater than -50dBm then the ACLR shall be higher than the value specified in Table 6.11. The requirements are applicable for all values of  $\beta_c$ ,  $\beta_d$ ,  $\beta_{hs}$ ,  $\beta_{ec}$  and  $\beta_{ed}$  as specified in [8].

| Power Class | Adjacent channel frequency relative<br>to assigned channel frequency | ACLR limit |
|-------------|----------------------------------------------------------------------|------------|
| 3           | + 5 MHz or - 5 MHz                                                   | 33 dB      |
| 3           | + 10 MHz or - 10 MHz                                                 | 43 dB      |
| 4           | + 5 MHz or - 5 MHz                                                   | 33 dB      |
| 4           | + 10 MHz or -10 MHz                                                  | 43 dB      |

#### Table 6.11: UE ACLR

NOTE 1: The requirement shall still be met in the presence of switching transients.

NOTE 2: The ACLR requirements reflect what can be achieved with present state of the art technology.

NOTE 3: Requirement on the UE shall be reconsidered when the state of the art technology progresses.

## 6.6.2.2.1A Additional requirement for DC-HSUPA

If the adjacent channel power is greater than -50dBm then the ACLR shall be higher than the value specified in Table 6.11A. The requirements are applicable for all values of  $\beta_c$ ,  $\beta_{hs}$ ,  $\beta_{ec}$  and  $\beta_{ed}$  as specified in [8]. The reference measurement channels for the requirements in subclause 6.6.2.2.1A are provided in subclause A.2.8.

| Power Class | Adjacent channel frequency relative to<br>the center of two assigned channel<br>frequencies | ACLR limit |
|-------------|---------------------------------------------------------------------------------------------|------------|
| 3           | + 7.5 MHz or – 7.5 MHz                                                                      | 33 dB      |
| 3           | + 12.5 MHz or – 12.5 MHz                                                                    | 36 dB      |
| 4           | + 7.5 MHz or – 7.5 MHz                                                                      | 33 dB      |
| 4           | + 12.5 MHz or -12.5 MHz                                                                     | 36 dB      |

Table 6.11A: UE ACLR for DC-HSUPA

NOTE 1: The requirement shall still be met in the presence of switching transients.

NOTE 2: The ACLR requirements reflect what can be achieved with present state of the art technology.

NOTE 3: Requirement on the UE shall be reconsidered when the state of the art technology progresses.

#### 6.6.2.2.1B Additional requirement for UL OLTD

For UE with two active transmit antenna connectors in UL OLTD operation, the ACLR requirements specified in subclause 6.6.2.2.1 apply at each transmit antenna connector.

#### 6.6.2.2.1C Additional requirement for UL CLTD

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the ACLR requirements specified in sub-clause 6.6.2.2.1 apply at each transmit antenna connector.

For UE configured in UL CLTD activation state 2 or activation state 3, the ACLR requirements specified in sub-clause 6.6.2.2.1 apply at the active transmit antenna connector.

#### 6.6.2.2.1D Additional requirement for UL MIMO

For UE with two active transmit antenna connectors in UL MIMO operation, the ACLR requirements specified in subclause 6.6.2.2.1 apply at each transmit antenna connector.

## 6.6.3 Spurious emissions

Spurious emissions are emissions which are caused by unwanted transmitter effects such as harmonics emission, parasitic emission, intermodulation products and frequency conversion products, but exclude out of band emissions.

The frequency boundary and the detailed transitions of the limits between the requirement for out band emissions and spectrum emissions are based on ITU-R Recommendations SM.329 [2].

#### 6.6.3.1 Minimum requirement

These requirements are only applicable for frequencies, which are greater than 12.5 MHz away from the UE centre carrier frequency.

| NOTE 5: For the 6.25kHz measurement bandwidth, the emissions measurement shall be sufficiently power averaged to ensure standard standard deviation < 0.5 dB. |                                                                                                                                                                                                                        |                                                                                                                       |                     |  |

 Table 6.13B: Additional spurious emissions requirements

## 6.6.3.1B Additional requirement for UL OLTD

For UE with two active transmit antenna connectors in UL OLTD operation, the requirements specified in sub-clause 6.6.3.1 apply at each transmit antenna connector.

## 6.6.3.1C Additional requirement for UL CLTD

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the spectrum emission requirements specified in sub-clause 6.6.3.1 apply at each transmit antenna connector.

For UE configured in UL CLTD activation state 2 or activation state 3, the spectrum emission requirements in subclause 6.6.3.1 apply at the active transmit antenna connector.

## 6.6.3.1D Additional requirement for UL MIMO

For UE with two active transmit antenna connectors in UL MIMO operation, the spectrum emission requirements specified in sub-clause 6.6.3.1 apply at each transmit antenna connector.

# 6.7 Transmit intermodulation

The transmit intermodulation performance is a measure of the capability of the transmitter to inhibit the generation of signals in its non linear elements caused by presence of the wanted signal and an interfering signal reaching the transmitter via the antenna.

## 6.7.1 Minimum requirement

User Equipment(s) transmitting in close vicinity of each other can produce intermodulation products, which can fall into the UE, or Node B receive band as an unwanted interfering signal. The UE intermodulation attenuation is defined by the ratio of the RRC filtered mean power of the wanted signal to the RRC filtered mean power of the intermodulation product when an interfering CW signal is added at a level below the wanted signal.

The requirement of transmitting intermodulation for a carrier spacing of 5 MHz is prescribed in Table 6.14.

#### Table 6.14: Transmit Intermodulation

| Interference Signal Frequency Offset | ffset 5MHz 10MHz |        |
|--------------------------------------|------------------|--------|
| Interference CW Signal Level         | -40dBc           |        |
| Intermodulation Product              | -31dBc           | -41dBc |

## 6.7.1A Additional requirement for DC-HSUPA

The UE intermodulation attenuation is defined by the ratio of the sum of the RRC filtered mean powers of the wanted signal on the assigned carriers to the sum of the RRC filtered mean powers of the intermodulation product on two adjacent carriers when an interfering CW signal is added at a level below the wanted signal.

The requirement of transmitting intermodulation for a carrier spacing of 5 MHz is prescribed in Table 6.14A.

#### Table 6.14A: Transmit Intermodulation requirement for DC-HSUPA

| Interference Signal Frequency Offset | al Frequency Offset 10MHz 20MHz |        |  |
|--------------------------------------|---------------------------------|--------|--|
| Interference CW Signal Level         | -40dBc                          |        |  |
| Intermodulation Product              | -31dBc                          | -41dBc |  |

## 6.7.1B Additional requirement for UL OLTD

For UE with two active transmit antenna connectors in UL OLTD operation, the requirements specified in sub-clause 6.7.1 apply at each transmit antenna connector.

# 6.7.1C Additional requirement for UL CLTD

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the requirements specified in subclause 6.7.1 apply at each transmit antenna connector.

For UE configured in UL CLTD activation state 2 or activation state 3, the requirements specified in sub-clause 6.7.1 apply at the active transmit antenna connector.

## 6.7.1D Additional requirement for UL MIMO

For UE with two active transmit antenna connectors in UL MIMO operation, the requirements specified in sub-clause 6.7.1 apply at each transmit antenna connector.

## 6.8 Transmit modulation

Transmit modulation defines the modulation quality for expected in-channel RF transmissions from the UE. The requirements apply to all transmissions including the PRACH pre-amble and message parts and all other expected transmissions. In cases where the mean power of the RF signal is allowed to change versus time e.g. PRACH, DPCH in compressed mode, change of TFC, inner loop power control and for HSDPA transmissions with non-constant HS-DPCCH code power, the EVM, Peak Code Domain Error and E-DCH Code Domain Error requirements do not apply during the 25 us period before and after the nominal time when the mean power is expected to change.

## 6.8.1 Transmit pulse shape filter

The transmit pulse shaping filter is a root-raised cosine (RRC) with roll-off  $\alpha$  =0.22 in the frequency domain. The impulse response of the chip impulse filter  $RC_0(t)$  is:

$$RC_{0}(t) = \frac{\sin\left(\pi \frac{t}{T_{c}}(1-\alpha)\right) + 4\alpha \frac{t}{T_{c}}\cos\left(\pi \frac{t}{T_{c}}(1+\alpha)\right)}{\pi \frac{t}{T_{c}}\left(1-\left(4\alpha \frac{t}{T_{c}}\right)^{2}\right)}$$

Where the roll-off factor  $\alpha = 0.22$  and the chip duration is

$$T = \frac{1}{chiprate} \approx 0.26042 \ \mu s$$

## 6.8.1A Additional requirement for UL OLTD

For UE with two active transmit antenna connectors in UL OLTD operation, the transmit pulse shape filter requirements specified in sub-clause 6.8.1 apply at each transmit antenna connector.

## 6.8.1B Additional requirement for UL CLTD

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the transmit pulse shape filter requirements specified in sub-clause 6.8.1 apply at each transmit antenna connector.

For UE configured in UL CLTD activation state 2 or activation state 3, the transmit pulse shape filter requirements specified in sub-clause 6.8.1 apply at the active transmit antenna connector.

## 6.8.1C Additional requirement for UL MIMO

For UE with two active transmit antenna connectors in UL MIMO operation, the transmit pulse shape filter requirements specified in sub-clause 6.8.1 apply at each transmit antenna connector.

## 6.8.2 Error Vector Magnitude

The Error Vector Magnitude is a measure of the difference between the reference waveform and the measured waveform. This difference is called the error vector. Both waveforms pass through a matched Root Raised Cosine filter with bandwidth 3,84 MHz and roll-off  $\alpha \square = 0,22$ . Both waveforms are then further modified by selecting the frequency, absolute phase, absolute amplitude and chip clock timing so as to minimise the error vector. The EVM result is defined as the square root of the ratio of the mean error vector power to the mean reference power expressed as a %. The measurement interval is one timeslot except when the mean power between slots is expected to change whereupon the measurement interval is reduced by 25 µs at each end of the slot. For the PRACH preamble the measurement interval is 4096 chips less 25 µs at each end of the burst (3904 chips).

When the UE uses 16QAM modulation on any of the uplink code channels in a carrier, the error minimization step also includes selecting an IQ origin offset besides selecting the frequency, absolute phase, absolute amplitude and chip clock timing to minimise the error vector. The IQ origin offset shall be removed from the evaluated signal before calculating the EVM; however, the removed relative IQ origin offset power (relative carrier leakage power) also has to satisfy the applicable requirement.

For signals containing more than one spreading code in a carrier where the slot alignment of the codes is not the same and the code power is varying, the period over which the nominal mean power in that carrier remains constant can be less than one timeslot. For such time-varying signals it is not possible to define EVM across one timeslot since this interval contains an expected change in mean power, and the exact timing and trajectory of the power change is not defined. For these signals, the EVM minimum requirements apply only for intervals of at least one half timeslot (less any 25µs transient periods) during which the nominal code power of each individual code is constant.

NOTE: The reason for setting a lower limit for the EVM measurement interval is that for any given impaired signal, the EVM would be expected to improve for measurement intervals less than one timeslot while the frequency error would be expected to degrade.

#### 6.8.2.1 Minimum requirement

When 16QAM modulation is not used on any of the uplink code channels, the Error Vector Magnitude shall not exceed 17.5 % for the parameters specified in Table 6.15.

When 16QAM modulation is used on any of the uplink code channels, the modulation accuracy requirement shall meet one or both of the following requirements:

- 1. The Error Vector Magnitude does not exceed 14 % for the parameters specified in Table 6.15.
- 2. The Relative Code Domain Error requirements specified in 6.8.3a are met.

The requirements are applicable for all values of  $\beta_c$ ,  $\beta_d$ ,  $\beta_{hs}$ ,  $\beta_{ec}$  and  $\beta_{ed}$  as specified in [8].

| Par                         | ameter | Unit  | Level                         |
|-----------------------------|--------|-------|-------------------------------|
| UE Output Power, no 16QAM   |        | dBm   | ≥ -20                         |
| UE Output Power, 16QAM      |        | dBm   | ≥ -30                         |
| Operating conditions        |        |       | Normal conditions             |
| Power control step size     |        | dB    | 1                             |
| Measurement                 | PRACH  |       | 3904                          |
| period<br>(Note 1) Any DPCH |        | Chips | From 1280 to 2560<br>(Note 2) |

## Table 6.15: Parameters for Error Vector Magnitude/Peak Code Domain Error

Note 2: The longest period over which the nominal power remains constant

When 16QAM modulation is used on any of the uplink code channels, the relative carrier leakage power (IQ origin offset power) shall not exceed the values specified in Table 6.15a

#### Table 6.15a: Relative Carrier Leakage Power

| UE Transmitted Mean     | Relative Carrier Leakage Power |
|-------------------------|--------------------------------|
| Power                   | (dB)                           |
| $P \ge -30 \text{ dBm}$ | < -17                          |

#### 6.8.2.1A Additional requirement for DC-HSUPA

When 16QAM modulation is not used on any of the uplink code channels in a carrier, the Error Vector Magnitude in that carrier shall not exceed 17.5 % for the parameters specified in Table 6.15AA.

When 16QAM modulation is used on any of the uplink code channels in a carrier, the modulation accuracy requirement shall meet one or both of the following requirements:

1. The Error Vector Magnitude does not exceed 14 % for the parameters specified in Table 6.15AA.

2. The Relative Code Domain Error requirements specified in 6.8.3a are met.

The requirements are applicable for all values of  $\beta_c$ ,  $\beta_{hs}$ ,  $\beta_{ec}$  and  $\beta_{ed}$  as specified in [8], when the total power in each of the assigned carriers is equal to each other. The reference measurement channels for the requirements in subclause 6.8.2.1A are provided in subclause A.2.6 and A.2.7.

| Parameter                 | Unit | Level             |
|---------------------------|------|-------------------|
| UE Output Power, no 16QAM | dBm  | ≥ -20             |
| UE Output Power, 16QAM    | dBm  | ≥ -30             |
| Operating conditions      |      | Normal conditions |
| Power control step size   | dB   | 1                 |

#### Table 6.15AA: Parameters for Error Vector Magnitude for DC-HSUPA

## 6.8.2.1B Additional requirement for UL OLTD

For UE with two active transmit antenna connectors in UL OLTD operation, the EVM requirements specified in subclause 6.8.2.1 except the requirement with PRACH apply at each transmit antenna connector.

### 6.8.2.1C Additional requirement for UL CLTD

When 16QAM modulation is not used on any of the uplink code channels, the Error Vector Magnitude shall not exceed 17.5 % for the parameters specified in Table 6.15AB at each transmit antenna connector.

When 16QAM modulation is used on any of the uplink code channels, the modulation accuracy requirement shall meet one or both of the following requirements:

- 1. The Error Vector Magnitude does not exceed 14 % for the parameters specified in Table 6.15AB at each transmit antenna connector.
- 2. The Relative Code Domain Error requirements specified in 6.8.3a are met at each transmit antenna connector.

The requirements are applicable for all values of  $\beta_c$ ,  $\beta_{sc}$ ,  $\beta_d$ ,  $\beta_{hs}$ ,  $\beta_{ec}$  and  $\beta_{ed}$  as specified in [8].

#### Table 6.15AB: Parameters for Error Vector Magnitude for UL CLTD

| Para                                                                     | neter    | Unit  | Level                         |
|--------------------------------------------------------------------------|----------|-------|-------------------------------|
| UE Output Power, no 16QAM                                                |          | dBm   | ≥ -20                         |
| UE Output Power, 16QAM                                                   |          | dBm   | ≥ -30                         |
| Operating conditions                                                     |          |       | Normal conditions             |
| Power control step size                                                  |          | dB    | 1                             |

| Note 1: Less any 25µs transient periods                                  |          |       |                               |
| Note 2: The longest period over which the nominal power remains constant |          |       |                               |

When 16QAM modulation is used on any of the uplink code channels, the relative carrier leakage power (IQ origin offset power) shall not exceed the values specified in Table 6.15a at each transmit antenna connector

### 6.8.2.1D Additional requirement for UL MIMO

When 16QAM modulation is not used on any of the uplink code channels, the Error Vector Magnitude shall not exceed 17.5 % for the parameters specified in Table 6.15AC at each transmit antenna connector.

When 16QAM modulation is used on any of the uplink code channels, the modulation accuracy requirement shall meet one or both of the following requirements:

- 1. The Error Vector Magnitude does not exceed 14 % for the parameters specified in Table 6.15AC.
- 2. The Relative Code Domain Error requirements specified in 6.8.3a are met.

The requirements are applicable for all values of  $\beta_c$ ,  $\beta_{sc}$ ,  $\beta_{hs}$ ,  $\beta_{ec}$ ,  $\beta_{sec}$ ,  $\beta_{ed}$  and  $\beta_{sed}$  as specified in [8].

| Parameter                 | Unit | Level             |
|---------------------------|------|-------------------|
| UE Output Power, no 16QAM | dBm  | ≥ -20             |
| UE Output Power, 16QAM    | dBm  | ≥ -30             |
| Operating conditions      |      | Normal conditions |
| Power control step size   | dB   | 1                 |

Table 6.15AC: Parameters for Error Vector Magnitude for UL MIMO

When 16QAM modulation is used on any of the uplink code channels, the relative carrier leakage power (IQ origin offset power) shall not exceed the values specified in Table 6.15a at each transmit antenna connector.

## 6.8.3 Peak code domain error

The Peak Code Domain Error is computed by projecting power of the error vector (as defined in 6.8.2) onto the code domain at a specific spreading factor. The Code Domain Error for every code in the domain is defined as the ratio of the mean power of the projection onto that code, to the mean power of the composite reference waveform. This ratio is expressed in dB. The Peak Code Domain Error is defined as the maximum value for the Code Domain Error for all codes. The measurement interval is one timeslot except when the mean power between slots is expected to change whereupon the measurement interval is reduced by 25  $\mu$ s at each end of the slot.

The requirement for peak code domain error is only applicable for multi-code DPDCH transmission and therefore does not apply for the PRACH preamble and message parts.

## 6.8.3.1 Minimum requirement

The peak code domain error shall not exceed -15 dB at spreading factor 4 for the parameters specified in Table 6.15. The requirements are defined using the UL reference measurement channel specified in subclause A.2.5.

## 6.8.3.1A Additional requirement for UL OLTD

For UE with two active transmit antenna connectors in UL OLTD operation, the Peak code domain error requirements specified in sub-clause 6.8.3.1 apply at each transmit antenna connector.

## 6.8.3.1B Additional requirement for UL CLTD

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the peak code domain error shall not exceed -15 dB at spreading factor 4 for the parameters specified in Table 6.15. The requirements are defined using the UL reference measurement channel specified in subclause A.2.5A.

For UE configured in UL CLTD activation state 2 or activation state 3, the Peak code domain error requirements specified in sub-clause 6.8.3.1 apply at the active transmit antenna connector.

## 6.8.3a Relative code domain error

### 6.8.3a.1 Relative Code Domain Error

The Relative Code Domain Error is computed by projecting the error vector (as defined in 6.8.2) onto the code domain. Only the code channels with non-zero betas in the composite reference waveform are considered for this requirement. The Relative Code Domain Error for every non-zero beta code in the domain is defined as the ratio of the mean power of the projection onto that non-zero beta code, to the mean power of the non-zero beta code in the composite reference waveform. This ratio is expressed in dB. The measurement interval is one timeslot except when the mean power between slots is expected to change whereupon the measurement interval is reduced by 25 µs at each end of the slot.

In the mode of DC-HSUPA, the requirement and corresponding measurements apply to each individual carrier when the total power in each of the assigned carriers is equal to each other.

The Relative Code Domain Error is affected by both the spreading factor and beta value of the various code channels in the domain. The Effective Code Domain Power (ECDP) is defined to capture both considerations into one parameter. It uses the Nominal CDP ratio (as defined in 6.2.3), and is defined as follows for each used code, k, in the domain:

 $ECDP_k = (Nominal CDP ratio)_k + 10*log10(SF_k/256)$ 

When 16QAM is not used on any of the UL code channels in a carrier, the requirements for Relative Code Domain Error are not applicable when either or both the following channel combinations occur:

- when the ECDP of any code channel is < -30dB
- when the nominal code domain power of any code channel is < -20 dB

When 16QAM is used on any of the UL code channels in a carrier, the requirements for Relative Code Domain Error are not applicable when either or both the following channel combinations occur:

- when the ECDP of any code channel is < -30dB
- when the nominal code domain power of any code channel is < -30 dB

The requirement for Relative Code Domain Error also does not apply for the PRACH preamble and message parts.

#### 6.8.3a.1.1 Minimum requirement

When 16QAM is not used on any of the UL code channels, the Relative Code Domain Error shall meet the requirements in Table 6.15B for the parameters specified in Table 6.15

#### Table 6.15B: Relative Code Domain Error minimum requirement

| ECDP dB          | Relative Code Domain<br>Error dB |
|------------------|----------------------------------|
| -21 < ECDP       | ≤ -16                            |
| -30 ≤ ECDP ≤ -21 | ≤ -37 – ECDP                     |
| ECDP < -30       | No requirement                   |

When 16QAM is used on any of the UL code channels, the Relative Code Domain Error of the codes not using 16QAM shall meet the requirements in Table 6.15C for the parameters specified in Table 6.15.

#### Table 6.15C: Relative Code Domain Error minimum requirement

| ECDP dB          | Relative Code Domain<br>Error dB |
|------------------|----------------------------------|
| -22 < ECDP       | ≤ -18                            |
| -30 ≤ ECDP ≤ -22 | ≤ -40 – ECDP                     |
| ECDP < -30       | No requirement                   |

When 16QAM is used on any of the UL code channels, the Nominal CDP Ratio-weighted average of the Relative Code Domain Errors measured individually on each of the codes using 16QAM shall meet the requirements in Table 6.15D for the parameters specified in Table 6.15. The Nominal CDP Ratio-weighted average of the Relative Code Domain Errors means the sum  $\sum_{k} 10^{(\text{Nominal CDP ratio})_{k}/10} \cdot 10^{(\text{Relative Code Domain Error})_{k}/10}$  over all code k that uses 16QAM.

For the purposes of evaluating the requirements specified in Table 6.15D, the ECDP value is determined as the minimum of the individual ECDP values corresponding to the codes using 16QAM.

#### Table 6.15D: Relative Code Domain Error minimum requirement

# ECDP dBAverage Relative Code<br/>Domain Error dB-25.5 < ECDP $\leq -18$ $-30 \leq ECDP \leq -25.5$ $\leq -43.5 - ECDP$ <br/>ECDP < -30No requirement

## 6.8.3a.1.1a Additional requirement for DC-HSUPA

When 16QAM is not used on any of the UL code channels in a carrier, the Relative Code Domain Error in that carrier shall meet the requirements in Table 6.15B for the parameters specified in Table 6.15AA.

When 16QAM is used on any of the UL code channels in a carrier, the Relative Code Domain Error of the codes not using 16QAM in that carrier shall meet the requirements in Table 6.15C for the parameters specified in Table 6.15AA.

When 16QAM is used on any of the UL code channels in a carrier, the Nominal CDP Ratio-weighted average of the Relative Code Domain Errors measured individually on each of the codes using 16QAM in that carrier shall meet the requirements in Table 6.15D for the parameters specified in Table 6.15AA.

For the purposes of evaluating the requirements specified in Table 6.15D, the ECDP value is determined as the minimum of the individual ECDP values corresponding to the codes using 16QAM.

The reference measurement channels for the requirements in subclause 6.8.3a.1.1a are provided in subclause A.2.6 and A.2.7.

## 6.8.3a.1.1b Additional requirement for UL OLTD

For UE with two active transmit antenna connectors in UL OLTD operation, the relative code domain error requirements specified in sub-clause 6.8.3a.1.1 apply at each transmit antenna connector.

## 6.8.3a.1.1c Additional requirement for UL CLTD

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the relative code domain error requirements specified in sub-clause 6.8.3a.1.1 apply at each transmit antenna connector.

For UE configured in UL CLTD activation state 2 or activation state 3, the relative code domain error requirements specified in sub-clause 6.8.3a.1.1 apply at the active transmit antenna connector.

## 6.8.3a.1.1d Additional requirement for UL MIMO

For UE with two active transmit antenna connectors in UL MIMO operation, the relative code domain error requirements specified in sub-clause 6.8.3a.1.1 apply at each transmit antenna connector.

## 6.8.3b In-band emission for DC-HSUPA

The in-band emission is measured as the ratio of the UE output power in one carrier in dual cells to the UE output power in the other carrier, where the power in the former carrier shall be set to the minimum output power and the power in the latter carrier to the maximum output power. The reference measurement channel for the requirements in subclause 6.8.3b.1 is provided in subclause A.2.6 with an adjusted power imbalance to set the power in one carrier to the minimum output power and the power in the other carrier to the maximum output power. The basic in-band emission measurement interval is defined over one slot in the time domain.

## 6.8.3b.1 Minimum requirement for DC-HSUPA

The in-band emission shall not exceed the value specified in Table 6.15E.

#### Table 6.15E: In-band emission minimum requirements for DC-HSUPA

|        | Parameter Description                                                                                                                                                                                                                                                                                     | Unit | Limit                 |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|-----------------------|
|        | In-band emission                                                                                                                                                                                                                                                                                          | dBc  | -24                   |
| Note : | ote : The measurement bandwidth is 3.84 MHz centered on each carrier frequency<br>and the limit is expressed as a ratio of RRC filtered mean power in one carrier,<br>transmitting at minimum output power, to the RRC filtered mean power in the<br>other carrier, transmitting at maximum output power. |      | power in one carrier, |

## 6.8.4 Phase discontinuity for uplink DPCH

Phase discontinuity is the change in phase between any two adjacent timeslots. The EVM for each timeslot (excluding the transient periods of 25  $\mu$ s on either side of the nominal timeslot boundaries), shall be measured according to subclause 6.8.2. The frequency, absolute phase, absolute amplitude and chip clock timing used to minimise the error vector are chosen independently for each timeslot. The phase discontinuity result is defined as the difference between the absolute phase used to calculate EVM for the preceding timeslot, and the absolute phase used to calculate EVM for the succeeding timeslot.

### 6.8.4.1 Minimum requirement

The rate of occurrence of any phase discontinuity on an uplink DPCH for the parameters specified in table 6.16 shall not exceed the values specified in table 6.17. Phase shifts that are caused by changes of the UL transport format combination (TFC), compressed mode and HS-DPCCH are not included. When calculating the phase discontinuity, the requirements for frequency error and EVM in subclauses 6.3 and 6.8.2 for each timeslot shall be met.

#### Table 6.16: Parameters for Phase discontinuity

| Parameter               | Unit | Level |
|-------------------------|------|-------|
| Power control step size | dB   | 1     |

| Table 6.17: Phase discontinuity minimum requirement | Table 6.17: Phase | e discontinuity | / minimum | requirement |
|-----------------------------------------------------|-------------------|-----------------|-----------|-------------|
|-----------------------------------------------------|-------------------|-----------------|-----------|-------------|

| Phase discontinuity Δθ<br>in degrees | Maximum allowed rate of<br>occurrence in Hz |
|--------------------------------------|---------------------------------------------|
| $\Delta \theta \leq 30$              | 1500                                        |
| $30 < \Delta \theta \le 60$          | 300                                         |
| $\Delta \theta > 60$                 | 0                                           |

## 6.8.4.1A Additional requirement for UL OLTD

For UE with two transmit antenna connectors in UL OLTD operation, the rate of occurrence of any phase discontinuity on an uplink DPCH for the parameters specified in table 6.16 shall not exceed the values specified in table 6.17 for each transmit antenna connector. In addition, the relative phase applied to the two transmit paths shall be fixed during the phase discontinuity test. Phase shifts that are caused by changes of the UL transport format combination (TFC), compressed mode and HS-DPCCH are not included. When calculating the phase discontinuity, the requirements for frequency error and EVM in subclauses 6.3B and 6.8.2 for each timeslot shall be met.

## 6.8.4.1B Additional requirement for UL CLTD

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the rate of occurrence of any phase discontinuity on an uplink DPCH for the parameters specified in table 6.16 shall not exceed the values specified in table 6.17 for each transmit antenna connector. In addition, TPI applied to the two transmit paths shall be fixed during the phase discontinuity test. Phase shifts that are caused by changes of the UL transport format combination (TFC), compressed mode and HS-DPCCH are not included. When calculating the phase discontinuity, the requirements for frequency error and EVM in subclauses 6.3C and 6.8.2 for each timeslot shall be met.

For UE configured in UL CLTD activation state 2 or activation state 3, the phase discontinuity for Uplink DPCH specified in sub-clause 6.8.4.1 applies at the active transmit antenna connector.

## 6.8.5 Phase discontinuity for HS-DPCCH

Phase discontinuity for HS-DPCCH is the change in phase due to the transmission of the HS-DPCCH. In the case where the HS-DPCCH timeslot is offset from the DPCCH timeslot, the period of evaluation of the phase discontinuity shall be the DPCCH timeslot that contains the HS-DPCCH slot boundary. The phase discontinuity for HS-DPCCH result is defined as the difference between the absolute phase used to calculate the EVM for that part of the DPCCH timeslot prior to the HS-DPCCH slot boundary, and the absolute phase used to calculate the EVM for remaining part of the DPCCH timeslot following the HS-DPCCH slot boundary. In all cases the subslot EVM is measured excluding the transient periods of 25  $\mu$ s.

Since subslot EVM is only defined for intervals of at least one half timeslot, the phase discontinuity for HS-DPCCH is only defined for non-aligned timeslots when the offset is 0.5 slots.

## 6.8.5.1 Minimum requirement

The phase discontinuity for HS-DPCCH shall not exceed the value specified in table 6.18 90% of the time. When calculating the phase discontinuity, the requirements for frequency error and EVM in sub clauses 6.3 and 6.8.2, respectively shall be met.

#### Table 6.18: Phase discontinuity minimum requirement for HS-DPCCH at HS-DPCCH slot boundary

| Phase discontinuity for<br>HS-DPCCH Δθ in | 40 < 30                 |
|-------------------------------------------|-------------------------|
|                                           | $\Delta \theta \leq 30$ |
| degrees                                   |                         |

## 6.8.5.1A Additional requirement for UL OLTD

For UE with two transmit antenna connectors in UL OLTD operation, the phase discontinuity for HS-DPCCH shall not exceed the value specified in table 6.18 90% of the time for each transmit antenna connector. In addition, the relative phase applied to the two transmit paths shall be fixed during the phase discontinuity test. When calculating the phase discontinuity, the requirements for frequency error and EVM in sub clauses 6.3B and 6.8.2, respectively shall be met.

## 6.8.5.1B Additional requirement for UL CLTD

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the phase discontinuity for HS-DPCCH shall not exceed the value specified in table 6.18 90% of the time for each transmit antenna connector. In addition, TPI applied to the two transmit paths shall be fixed during the phase discontinuity test. When calculating the phase discontinuity, the requirements for frequency error and EVM in sub clauses 6.3C and 6.8.2, respectively shall be met.

For UE configured in UL CLTD activation state 2 or activation state 3, the phase discontinuity for HS-DPCCH specified in sub-clause 6.8.5.1 applies at the active transmit antenna connector.

## 6.8.6 Phase discontinuity for E-DCH

Phase discontinuity for E-DCH is the change in phase due to the transmission of DPCCH, HS-DPCCH, E-DPCCH and E-DCH with the combined transmit power profile as defined in Table 6.19. The phase discontinuity for E-DCH result is defined as the difference between the absolute phase used to calculate the EVM for the preceding timeslot, and the absolute phase used to calculate the EVM for the succeeding timeslot.

| Slot<br>Number | $\left(rac{oldsymbol{eta}_{ec}}{oldsymbol{eta}_{c}} ight)$ | $\left(rac{oldsymbol{eta}_{ed}}{oldsymbol{eta}_{c}} ight)$ | $\left(rac{oldsymbol{eta}_{hs}}{oldsymbol{eta}_{c}} ight)$ |  |  |

Table 6.19 Transmit power profile for E-DCH phase discontinuity test

### 6.8.6.1 Minimum requirement

When transmitting according to the power profile specified in Table 6.19, the phase discontinuity for E-DCH shall not exceed the value specified in table 6.20 for the specified amount of time in table 6.20. The requirement applies for the range of DPCCH powers according to table 6.20. When calculating the phase discontinuity, the requirements for frequency error and EVM in sub clauses 6.3 and 6.8.2, respectively shall be met.

| Table 6.20: Phase discontinuity | minimum requirement for E-DCH |
|---------------------------------|-------------------------------|
|---------------------------------|-------------------------------|

|  |                         | Minimum allowed time | DPCCH power in dBm                                   |
|--|-------------------------|----------------------|------------------------------------------------------|
|  | in degrees              | in percentage        |                                                      |
|  | $\Delta \theta \leq 15$ | 80                   |                                                      |
|  | $\Delta \theta \leq 35$ | 90                   | -15 $\leq$ DPCCH power $\leq$ (P <sub>max</sub> -20) |
|  | $\Delta \theta \leq 45$ | 100                  |                                                      |

## 6.8.6.1A Additional requirement for UL OLTD

For UE with two transmit antenna connectors in UL OLTD operation, when transmitting according to the power profile specified in Table 6.19, the phase discontinuity for E-DCH shall not exceed the value specified in table 6.20 for the specified amount of time in table 6.20 for each transmit antenna connector. The requirement applies for the range of DPCCH powers according to table 6.20. In addition, the relative phase applied to the two transmit paths shall be fixed

during the phase discontinuity test. When calculating the phase discontinuity, the requirements for frequency error and EVM in sub clauses 6.3B and 6.8.2, respectively shall be met.

## 6.8.6.1B Additional requirement for UL CLTD

For UE configured in UL CLTD activation state 2 or activation state 3, the phase discontinuity for E-DCH specified in sub-clause 6.8.6.1 applies at the active transmit antenna connector.

## 6.8.7 Time alignment error for DC-HSUPA

In DC-HSUPA transmission, signals are transmitted for dual cells. These signals shall be aligned. The time alignment error in DC-HSUPA transmission is specified as the delay between the signals from primary and secondary uplink frequencies at the antenna port.

## 6.8.7.1 Minimum requirement

The time alignment error shall not exceed <sup>3</sup>/<sub>4</sub> Tc.

## 6.8.7A Time alignment error for UL OLTD

For UE with two active transmit antenna connectors in UL OLTD operation, the signals transmitted in the two antenna connectors shall be aligned. The time alignment error in UL OLTD operation transmission is specified as the delay between the signals from two antenna connectors.

## 6.8.7A.1 Minimum requirement

The time alignment error shall not exceed 0.4Tc.

## 6.8.7B Time alignment error for UL CLTD

For UE with two active transmit antenna connectors in UL CLTD activation state 1, the signals transmitted in the two antenna connectors shall be aligned. The time alignment error in UL CLTD activation state 1 transmission is specified as the delay between the signals from two antenna connectors.

## 6.8.7B.1 Minimum requirement

The time alignment error shall not exceed 0.4Tc.

## 6.8.7C Time alignment error for UL MIMO

For UE with two active transmit antenna connectors in UL MIMO operation, the signals transmitted in the two antenna connectors shall be aligned. The time alignment error in UL MIMO transmission is specified as the delay between the signals from two antenna connectors.

## 6.8.7C.1 Minimum requirement

The time alignment error shall not exceed 0.4Tc.

## 7 Receiver characteristics

## 7.1 General

Unless otherwise stated the receiver characteristics are specified at the antenna connector of the UE. For UE(s) with an integral antenna only, a reference antenna with a gain of 0 dBi is assumed. UE with an integral antenna may be taken into account by converting these power levels into field strength requirements, assuming a 0 dBi gain antenna. For UEs

with more than one receiver antenna connector the AWGN signals applied to each receiver antenna connector shall be uncorrelated. The levels of the test signal applied to each of the antenna connectors shall be as defined in the respective sections below.

The UE antenna performance has a significant impact on system performance, and minimum requirements on the antenna efficiency are therefore intended to be included in future versions of the present document. It is recognised that different requirements and test methods are likely to be required for the different types of UE.

UEs supporting DC-HSDPA, regardless of MIMO configuration, shall support both minimum requirements, as well as additional requirements for DC-HSDPA.

UEs supporting DB-DC-HSDPA shall support both minimum requirements as well as additional requirements for DB-DC-HSDPA.

UEs supporting DC-HSUPA shall support both minimum requirements, as well as additional requirements for DC-HSUPA.

UEs supporting single band 4C-HSDPA shall support minimum requirements, additional requirements for DC-HSDPA as well as additional requirements for single band 4C-HSDPA.

UEs supporting dual band 4C-HSDPA shall support minimum requirements, additional requirements for DC-HSDPA, additional requirements for DB-DC-HSDPA as well as additional requirements for dual band 4C-HSDPA.

UEs supporting single band 8C-HSDPA shall support minimum requirements, additional requirements for DC-HSDPA and single band 4C-HSDPA as well as additional requirements for single band 8C-HSDPA.

UEs supporting single band NC-4C-HSDPA shall support minimum requirements, additional requirements for DC-HSDPA as well as additional requirements for NC-4C-HSDPA.

For minimum requirements, all the parameters in clause 7 are defined using the DL reference measurement channel (12.2 kbps) specified in subclause A.3.1 and unless otherwise stated with DL power control OFF.

For the additional requirements for DC-HSDPA, DB-DC-HSDPA, DC-HSUPA, single band/dual band 4C-HSDPA or single band 8C-HSDPA or single band NC-4C-HSDPA, all the parameters in clause 7 are defined using the DL reference measurement channel H-Set 12, specified in subclause A.7.1.12 and the downlink physical channel setup according to table C.12C.

For the additional requirements for DC-HSDPA, the spacing of the carrier frequencies of the two cells in downlink shall be 5 MHz, and it is assumed that the UE is configured with a single uplink carrier frequency.

For the additional requirements for DC-HSUPA, the spacing of the carrier frequencies of the two cells in both downlink and uplink shall be 5 MHz.

For the additional requirements for single band/dual band 4C-HSDPA or single band NC-4C-HSDPA, the spacing of the adjacent carrier frequencies in downlink and uplink shall be 5 MHz.

For the additional requirements for single 8C-HSDPA, the spacing of the adjacent carrier frequencies in downlink and uplink shall be 5 MHz.

For each single band/dual band 4C-HSDPA and single band 8C-HSDPA or single band NC-4C-HSDPA configuration, the UL-DL carrier separation is defined as minimum (maximum) when the UL carrier is placed at minimum (maximum) possible distance in frequency from the closest carrier in the corresponding DL band for which the requirement applies.

The requirements specified in Section 7 in general could be different for each single band/dual band 4C-HSDPA or single band NC-4C-HSDPA configuration within the same operating band(s).

For the additional requirements for single band NC-4C-HSDPA, in-gap test refers to the case when the interfering signal is located at a positive offset with respect to the the assigned channel frequency of the highest carrier frequency of the left end subblock; or located at a negative offset with respect to the assigned channel frequency of the lowest carrier frequency of the right end subblock.

For the additional requirements for single band NC-4C-HSDPA out-of-gap test refers to the case when the interfering signal(s) is (are) located at a positive offset with respect to the assigned channel frequency of the highest carrier frequency, or located at a negative offset with respect to the assigned channel frequency of the lowest carrier frequency.

For the additional requirements for single band NC-4C-HSDPA, existing blocking characteristics requirements shall be supported for in-gap tests only if the gap length satisfies the following condition so that the interferer position does not change the nature of the core requirement tested:

Gap length  $\geq 2*$ Interferer frequency offset -5MHz

## 7.2 Diversity characteristics

A suitable receiver structure using coherent reception in both channel impulse response estimation and code tracking procedures is assumed. Three forms of diversity are considered to be available in UTRA/FDD.

| Time diversity          | Channel coding and interleaving in both up link and down link                                                                                                                                  |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Multi-path<br>diversity | Rake receiver or other suitable receiver structure with maximum combining. Additional processing elements can increase the delay-spread performance due to increased capture of signal energy. |
| Antenna diversity       | Antenna diversity with maximum ratio combing in the Node B and optionally in the UE. Possibility for downlink transmit diversity in the Node B.                                                |

#### Table 7.1: Diversity characteristics for UTRA/FDD

## 7.3 Reference sensitivity level

The reference sensitivity level <REFSENS> is the minimum mean power received at the UE antenna port at which the specified minimum requirement shall be met.

## 7.3.1 Minimum requirement

The BER shall not exceed 0.001 for the parameters specified in Table 7.2.

| Operating Band |                                                                                                                                                                                | Unit                                       | DPCH_Ec <refsens></refsens>                                                 | <refî<sub>or&gt;</refî<sub> |  |  |

|                | XXVI when the carrier frequency of the assigned UTRA channel is within 869-894                                                                                                 |                                            |                                                                             |                             |  |  |
|                | MHz. The corresponding <refî<sub>or&gt; is -104.7 dBm.</refî<sub>                                                                                                              |                                            |                                                                             |                             |  |  |

Table 7.2: Test parameters for reference sensitivity, minimum requirement.

For the UE which supports DB-DC-HSDPA configuration in Table 7.2aA, the reference sensitivity level DPCH\_Ec <REFSENS> and corresponding <REF $\hat{I}_{or}$ > in Table 7.2 are allowed to be increased by the amount given in Table 7.2aA for the applicable bands.

# Table 7.2aA: Allowed de-sensitization relative to reference sensitivity for UE which supports DB-DC-HSDPA.

| DB-DC-HSDPA<br>Configuration | Allowed de-sensitization (dB) | Applicable bands |  |
|------------------------------|-------------------------------|------------------|--|
| 2                            | 1                             | II, IV           |  |
| 4                            | 1                             | I, XI            |  |

For the UE which supports dual band 4C-HSDPA configuration in Table 7.2aB, the reference sensitivity level DPCH\_Ec <REFSENS> and corresponding <REF $\hat{I}_{or}$ > in Table 7.2 are allowed to be increased by the amount given in Table 7.2aB for the applicable bands.

## Table 7.2aB: Allowed de-sensitization relative to reference sensitivity for UE which supports dual band 4C-HSDPA.

| Dual Band<br>4C-HSDPA<br>Configuration | Allowed de-sensitization (dB) | Applicable bands |
|----------------------------------------|-------------------------------|------------------|
| II-1-IV-2<br>II-2-IV-1<br>II-2-IV-2    | 1                             | II, IV           |

For the UE which supports E-UTRA inter-band carrier aggregation the reference sensitivity level DPCH\_Ec <br/> <br/> <br/> <br/> <br/> <br/> REFSENS> and corresponding <br/> <br/> REFÎ\_or> in Table 7.2 are allowed to be increased by the amount given in Table 7.3.1-

1A of TS 36.101[11] for those UTRA operating bands corresponding to the E-UTRA operating bands that belong to the supported inter-band carrier aggregation configurations. The tolerance in Table 7.3.1-1A of TS 36.101[11] does not apply to supported UTRA operating bands with frequency range below 1 GHz that correspond to the E-UTRA operating bands that belong to the supported inter-band carrier aggregation configurations when such bands are belonging only to band combination(s) where one band is <1GHz and another band is >1.7GHz and there is no harmonic relationship between the low band UL and high band DL.

In case the UE supports DB-DC-HSDPA or dual band 4C-HSDPA configurations and one or more of the E-UTRA inter-band carrier aggregation configurations listed in Table 7.3.1-1A of TS36.101[11] with a UTRA operating band that belongs to UTRA and E-UTRA carrier aggregation configurations, then

- When the UTRA operating band frequency range is ≤ 1GHz, the applicable additional tolerance shall be the average of the applicable tolerances, truncated to one decimal place for that operating band among the supported DB-DC-HSDPA, dual band 4C-HSDPA, and E-UTRA CA configurations, with the DB-DC-HSDPA, dual carrier 4C-HSDPA, and E-UTRA CA configurations counted separately. In case there is a harmonic relation between low band UL and high band DL, then the maximum tolerance among the different supported carrier aggregation configurations involving such band shall be applied
- When the UTRA operating band frequency range is >1GHz, the applicable additional tolerance shall be the maximum tolerance that applies for that operating band among the supported DB-DC-HSDPA, dual band HSDPA, and E-UTRA CA configurations.

## 7.3.2 Additional requirement for DC-HSDPA

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.2A.

Note: The reference sensitivity level <REFSENS> requirement for DC-HSDPA is not applicable for dual uplink operation. However, there might be a substantial Rx de-sensitization for the UE operating in bands which have less than 80 MHz Tx-Rx frequency separation, transmitting on more than one uplink frequency, at maximum power.

| Operating Band                                                                                                            |                                                                                                                                                                          | Unit         | HS-PDSCH_Ec<br><refsens></refsens> | <refî<sub>or&gt;</refî<sub> |  |

| NOTE 4 For the UE which supports both Band XI and Band XXI operating frequencies, the reference sensitivity level is FFS. |                                                                                                                                                                          |              |                                    | g frequencies, the          |  |
| NOTE 5                                                                                                                    |                                                                                                                                                                          |              |                                    |                             |  |

For the UE which supports DB-DC-HSDPA configuration in Table 7.2AA, the reference sensitivity level HS-PDSCH\_Ec <REFSENS> and corresponding <REF $\hat{I}_{or}$ > in Table 7.2A are allowed to be increased by the amount given in Table 7.2AA for the applicable bands.

# Table 7.2AA: Allowed de-sensitization relative to referenece sensitivity for UE which supports DB-DC-HSDPA.

| DB-DC-HSDPA<br>Configuration | Allowed de-sensitization (dB) | Applicable bands |  |
|------------------------------|-------------------------------|------------------|--|
| 2                            | 1                             | II, IV           |  |
| 4                            | 1                             | I, XI            |  |

For the UE which supports dual band 4C-HSDPA configuration in Table 7.2AB, the reference sensitivity level HS-PDSCH\_Ec <REFSENS> and corresponding <REF $\hat{I}_{or}$ > in Table 7.2A are allowed to be increased by the amount given in Table 7.2AB for the applicable bands.

# Table 7.2AB: Allowed de-sensitization relative to reference sensitivity for UE which supports dual band 4C-HSDPA.

| Dual Band<br>4C-HSDPA<br>Configuration | Allowed de-sensitization (dB) | Applicable bands |
|----------------------------------------|-------------------------------|------------------|
| II-1-IV-2                              |                               |                  |
| II-2-IV-1                              | 1                             | II, IV           |
| II-2-IV-2                              |                               |                  |

For the UE which supports E-UTRA inter-band carrier aggregation the reference sensitivity level HS-PDSCH\_Ec <REFSENS> and corresponding <REF $\hat{I}_{or}$ > in Table 7.2A are allowed to be increased by the amount given in Table 7.3.1-1A of TS 36.101[11] for those UTRA operating bands corresponding to the E-UTRA operating bands that belong to the supported inter-band carrier aggregation configurations. The tolerance in Table 7.3.1-1A of TS 36.101[11] does not apply to supported UTRA operating bands with frequency range below 1 GHz that correspond to the E-UTRA operating bands are belonging only to band combination(s) where one band is <1GHz and another band is >1.7GHz and there is no harmonic relationship between the low band UL and high band DL.

In case the UE supports DB-DC-HSDPA or dual band 4C-HSDPA configurations and one or more of the E-UTRA inter-band carrier aggregation configurations listed in Table 7.3.1-1A of TS36.101[11] with a UTRA operating band that belongs to UTRA and E-UTRA carrier aggregation configurations, then

- When the UTRA operating band frequency range is ≤ 1GHz, the applicable additional tolerance shall be the average of the applicable tolerances, truncated to one decimal place for that operating band among the supported DB-DC-HSDPA, dual band 4C-HSDPA, and E-UTRA CA configurations, with the DB-DC-HSDPA, dual carrier 4C-HSDPA, and E-UTRA CA configurations counted separately. In case there is a harmonic relation between low band UL and high band DL, then the maximum tolerance among the different supported carrier aggregation configurations involving such band shall be applied
- When the UTRA operating band frequency range is >1GHz, the applicable additional tolerance shall be the maximum tolerance that applies for that operating band among the supported DB-DC-HSDPA, dual band 4C-HSDPA, and E-UTRA CA configurations.

## 7.3.3 Additional requirement for DB-DC-HSDPA

For all requirements listed in Table 7.2.B, corresponding to the specific DB-DC-HSDPA configuration(s) supported by the UE, (see Table 5.0aA), the BLER measured on each individual cell shall not exceed 0.1.

| DB-DC-<br>HSDPA<br>configuration                                                                                                            | DL Band | UL Band | Unit         | HS-PDSCH_Ec<br><refsens></refsens> | <refî<sub>or&gt;</refî<sub> |

| NOTE 1For Power class 3 and 3bis this shall be at the maximum output powerNOTE 2For Power class 4 this shall be at the maximum output power |         |         |              |                                    |                             |

Table 7.2B: Test parameters for reference sensitivity, additional requirement for DB-DC-HSDPA.

## 7.3.4 Additional requirement for single band 4C-HSDPA

For all requirements listed in Table 7.2C, corresponding to the specific single band 4C-HSDPA configuration(s) supported by the UE, (see Table 5.0aB), the BLER measured on each individual cell shall not exceed 0.1.

Note: The reference sensitivity level <REFSENS> requirement for single band 4C-HSDPA is not applicable for dual uplink operation. However, there might be a substantial Rx de-sensitization for the UE operating in bands which have less than 80 MHz Tx-Rx frequency separation, transmitting on more than one uplink frequency, at maximum power.

 Table 7.2C: Test parameters for reference sensitivity, additional requirement for single band 4C-HSDPA.

| Single band<br>4C-HSDPA<br>configuration | DL Band                                                                         | Unit         | HS-PDSCH_Ec<br><refsens></refsens> | <refî<sub>or&gt;</refî<sub> | UL-DL<br>carrier<br>separation |  |
|------------------------------------------|---------------------------------------------------------------------------------|--------------|------------------------------------|-----------------------------|--------------------------------|--|
| I-3                                      | I                                                                               | dBm/3.84 MHz | -113                               | -102.7                      | Minimum                        |  |
| II-3, II-4                               |                                                                                 | dBm/3.84 MHz | -111                               | -100.7                      | Minimum                        |  |
| NOTE 1 For P                             | NOTE 1 For Power class 3, 3bis and 4, this shall be at the maximum output power |              |                                    |                             |                                |  |

For the UE which supports DB-DC-HSDPA configuration in Table 7.2CA, the reference sensitivity level HS-PDSCH\_Ec <REFSENS> and corresponding <REF $\hat{I}_{or}$ > in Table 7.2C are allowed to be increased by the amount given in Table 7.2CA for the applicable bands.

#### Table 7.2CA: Allowed de-sensitization relative to reference sensitivity for UE which supports DB-DC-HSDPA.

| DB-DC-HSDPA<br>Configuration | Allowed de-sensitization (dB) | Applicable bands |
|------------------------------|-------------------------------|------------------|
| 2                            | 1                             |                  |
| 4                            | 1                             | I                |

For the UE which supports dual band 4C-HSDPA configuration in Table 7.2CB, the reference sensitivity level HS-PDSCH\_Ec <REFSENS> and corresponding <REF $\hat{I}_{or}$ > in Table 7.2C are allowed to be increased by the amount given in Table 7.2CB for the applicable bands.

# Table 7.2CB: Allowed de-sensitization relative to reference sensitivity for UE which supports dual band 4C-HSDPA.

| Dual Ba<br>4C-HSD<br>Configura | PA | Allowed de-sensitization (dB) | Applicable bands |
|--------------------------------|----|-------------------------------|------------------|
| II-1-IV                        | -2 |                               |                  |
| II-2-IV                        | -1 | 1                             | II               |
| II-2-IV                        | -2 |                               |                  |

For the UE which supports E-UTRA inter-band carrier aggregation the reference sensitivity level HS-PDSCH\_Ec <REFSENS> and corresponding <REFÎ<sub>or</sub>> in Table 7.2C are allowed to be increased by the amount given in Table 7.3.1-1A of TS 36.101[11] for those UTRA operating bands corresponding to the E-UTRA operating bands that belong to the supported inter-band carrier aggregation configurations. The tolerance in Table 7.3.1-1A of TS 36.101[11] does not apply to supported UTRA operating bands with frequency range below 1 GHz that correspond to the E-UTRA operating bands are belonging only to band combination(s) where one band is <1GHz and another band is >1.7GHz and there is no harmonic relationship between the low band UL and high band DL.

In case the UE supports DB-DC-HSDPA configurations and one or more of the E-UTRA inter-band carrier aggregation configurations listed in Table 7.3.1-1A of TS36.101[11] with a UTRA operating band that belongs to UTRA and E-UTRA carrier aggregation configurations, then

When the UTRA operating band frequency range is ≤ 1GHz, the applicable additional tolerance shall be the average of the applicable tolerances, truncated to one decimal place for that operating band among the supported DB-DC-HSDPA and E-UTRA CA configurations, with the DB-DC-HSDPA and E-UTRA CA configurations counted separately. In case there is a harmonic relation between low band UL and high band DL, then the maximum tolerance among the different supported carrier aggregation configurations involving such band shall be applied

- When the UTRA operating band frequency range is >1GHz, the applicable additional tolerance shall be the maximum tolerance that applies for that operating band among the supported DB-DC-HSDPA and E-UTRA CA configurations.

## 7.3.5 Additional requirement for dual band 4C-HSDPA

For all requirements listed in Table 7.2D, corresponding to the specific dual band 4C-HSDPA configuration(s) supported by the UE, (see Table 5.0aC), the BLER measured on each individual cell shall not exceed 0.1.

Note: The reference sensitivity level <REFSENS> requirement for dual band 4C-HSDPA is not applicable for dual uplink operation. However, there might be a substantial Rx de-sensitization for the UE operating in bands which have less than 80 MHz Tx-Rx frequency separation, transmitting on more than one uplink frequency, at maximum power.

# Table 7.2D: Test parameters for reference sensitivity, additional requirement for dual band 4C-HSDPA.

| Dual band<br>4C-HSDPA<br>configuration                                          | DL Band | UL Band | Unit         | HS-PDSCH_Ec<br><refsens></refsens> | <refî<sub>or&gt;</refî<sub> | UL-DL<br>carrier<br>separation |
|---------------------------------------------------------------------------------|---------|---------|--------------|------------------------------------|-----------------------------|--------------------------------|
| I-2-VIII-1                                                                      | I       | 1       | dBm/3.84 MHz | -113                               | -102.7                      | Minimum                        |
| I-3-VIII-1                                                                      | VIII    | I       | dBm/3.84 MHz | -110                               | -99.7                       | Minimum                        |
| I-2-VIII-2                                                                      |         | VIII    | dBm/3.84 MHz | -113                               | -102.7                      | Minimum                        |
| I-1-VIII-2                                                                      | VIII    | VIII    | dBm/3.84 MHz | -110                               | -99.7                       | Minimum                        |

| NOTE 1 For Power class 3, 3bis and 4, this shall be at the maximum output power |         |         |              |                                    |                             |                                |

## 7.3.6 Additional requirement for single band 8C-HSDPA

For all requirements listed in Table 7.2E, corresponding to the specific single band 8C-HSDPA configuration(s) supported by the UE, (see Table 5.0aD), the BLER measured on each individual cell shall not exceed 0.1.

Note: The reference sensitivity level <REFSENS> requirement for single band 8C-HSDPA is not applicable for dual uplink operation. However, there might be a substantial Rx de-sensitization for the UE operating in bands which have less than 80 MHz Tx-Rx frequency separation, transmitting on more than one uplink frequency, at maximum power.

# Table 7.2E: Test parameters for reference sensitivity, additional requirement for single band 8C-HSDPA.

| Single band<br>8C-HSDPA<br>configuration                                        | DL Band | Unit         | HS-PDSCH_Ec<br><refsens></refsens> | <refî<sub>or&gt;</refî<sub> | UL-DL<br>carrier<br>separation |
|---------------------------------------------------------------------------------|---------|--------------|------------------------------------|-----------------------------|--------------------------------|
| I-8                                                                             | I       | dBm/3.84 MHz | -113                               | -102.7                      | Minimum                        |
| NOTE 1 For Power class 3, 3bis and 4, this shall be at the maximum output power |         |              |                                    |                             |                                |

## 7.3.7 Additional requirement for single band NC-4C-HSDPA

For all requirements listed in Table 7.2E, corresponding to the specific single band NC-4C-HSDPA configuration(s) supported by the UE, (see Table 5.0aE), the BLER measured on each individual cell shall not exceed 0.1.

Note: The reference sensitivity level <REFSENS> requirement for single band NC-4C-HSDPA is not applicable for dual uplink operation. However, there might be a substantial Rx de-sensitization for the UE operating in bands which have less than 80 MHz Tx-Rx frequency separation, transmitting on more than one uplink frequency, at maximum power.

#### Table 7.2E: Test parameters for reference sensitivity, additional requirement for single band NC-4C-HSDPA.

| Single band NC-4C-<br>HSDPA configuration                                       | DL<br>Band | Unit         | HS-PDSCH_Ec<br><refsens></refsens> | <refî<sub>or&gt;</refî<sub> | UL-DL<br>carrier<br>separation |
|---------------------------------------------------------------------------------|------------|--------------|------------------------------------|-----------------------------|--------------------------------|
| I-1-5-1, I-2-5-1, I-3-10-1                                                      |            | dBm/3.84 MHz | -113                               | -102.7                      | Minimum                        |
| IV-1-5-1, IV-2-10-1, IV-2-<br>15-2, IV-2-20-1, IV-2-25-2                        | IV         | dBm/3.84 MHz | -113                               | -102.7                      | Minimum                        |
| NOTE 1 For Power class 3, 3bis and 4, this shall be at the maximum output power |            |              |                                    |                             |                                |

For the UE which supports DB-DC-HSDPA configuration in Table 7.2F, the reference sensitivity level HS-PDSCH\_Ec  $\langle \text{REFSENS} \rangle$  and corresponding  $\langle \text{REFI}_{or} \rangle$  in Table 7.2E are allowed to be increased by the amount given in Table 7.2F for the applicable bands.

# Table 7.2F: Allowed de-sensitization relative to reference sensitivity for UE which supports DB-DC-HSDPA.

| DB-DC-HSDPA<br>Configuration | Allowed de-sensitization (dB) | Applicable bands |
|------------------------------|-------------------------------|------------------|
| 2                            | 1                             | IV               |
| 4                            | 1                             |                  |

For the UE which supports dual band 4C-HSDPA configuration in Table 7.2G, the reference sensitivity level HS-PDSCH\_Ec <REFSENS> and corresponding <REF $\hat{I}_{or}$ > in Table 7.2E are allowed to be increased by the amount given in Table 7.2G for the applicable bands.

# Table 7.2G: Allowed de-sensitization relative to reference sensitivity for UE which supports dual band 4C-HSDPA.

| Dual Band<br>4C-HSDPA<br>Configuration | Allowed de-sensitization (dB) | Applicable bands |
|----------------------------------------|-------------------------------|------------------|
| II-1-IV-2<br>II-2-IV-1                 | 1                             | IV               |
| II-2-IV-2                              |                               |                  |

For the UE which supports E-UTRA inter-band carrier aggregation the reference sensitivity level HS-PDSCH\_Ec <REFSENS> and corresponding <REF $\hat{I}_{or}$ > in Table 7.2E are allowed to be increased by the amount given in Table 7.3.1-1A of TS 36.101[11] for those UTRA operating bands corresponding to the E-UTRA operating bands that belong to the supported inter-band carrier aggregation configurations. The tolerance in Table 7.3.1-1A of TS 36.101[11] does not apply to supported UTRA operating bands with frequency range below 1 GHz that correspond to the E-UTRA operating bands are belonging only to band combination(s) where one band is <1GHz and another band is >1.7GHz and there is no harmonic relationship between the low band UL and high band DL.

In case the UE supports DB-DC-HSDPA configurations and one or more of the E-UTRA inter-band carrier aggregation configurations listed in Table 7.3.1-1A of TS36.101[11] with a UTRA operating band that belongs to UTRA and E-UTRA carrier aggregation configurations, then

When the UTRA operating band frequency range is ≤ 1GHz, the applicable additional tolerance shall be the average of the applicable tolerances, truncated to one decimal place for that operating band among the supported DB-DC-HSDPA and E-UTRA CA configurations, with the DB-DC-HSDPA and E-UTRA CA configurations counted separately. In case there is a harmonic relation between low band UL and high band DL, then the maximum tolerance among the different supported carrier aggregation configurations involving such band shall be applied

- When the UTRA operating band frequency range is >1GHz, the applicable additional tolerance shall be the maximum tolerance that applies for that operating band among the supported DB-DC-HSDPA and E-UTRA CA configurations.

## 7.4 Maximum input level

This is defined as the maximum mean power received at the UE antenna port, at which the specified BER performance shall be met.

## 7.4.1 Minimum requirement for DPCH reception

The BER shall not exceed 0.001 for the parameters specified in Table 7.3.

| Parameter                                                                                        | Unit         | Level                                                                  |  |  |
|--------------------------------------------------------------------------------------------------|--------------|------------------------------------------------------------------------|--|--|
| $\frac{DPCH\_Ec}{I_{or}}$                                                                        | dB           | -19                                                                    |  |  |
| Î <sub>or</sub>                                                                                  | dBm/3.84 MHz | -25                                                                    |  |  |
| UE transmitted mean power                                                                        | dBm          | 20 (for Power class 3 and<br>3bis)<br>18 (for Power class 4)<br>NOTE 1 |  |  |
| NOTE 1: The UE transmitted mean power shall be reduced by 0.5dB for a UE operating in band XXII. |              |                                                                        |  |  |

Table 7.3: Maximum input level

NOTE: Since the spreading factor is large (10log(SF)=21dB), the majority of the total input signal consists of the OCNS interference. The structure of OCNS signal is defined in Annex C.3.2.

## 7.4.2 Minimum requirement for HS-PDSCH reception

## 7.4.2.1 Minimum requirement for 16QAM

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channel H-Set 1 (16QAM version) specified in Annex A.7.1.1 with the addition of the parameters in Table 7.3A and the downlink physical channel setup according to table C.8.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 7.3B.

| Parameter                                                                                                                                                                                                                                                                                                           | Unit         | Value                                                               |  |  |

## 7.4.2.2 Minimum requirement for 64QAM

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channel H-Set 8 specified in Annex A.7.1.8. with the addition of the parameters in Table 7.3C and the downlink physical channel setup according to table C.8.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 7.3D.

| Parameter                                                                                                                                                                                    | Unit         | Value   |  |

## 7.4.3 Additional requirement for DC-HSDPA and DB-DC-HSDPA

## 7.4.3.1 Additional requirement for 16QAM

The additional requirements are specified in terms of a minimum information throughput per cell R with the DL reference channel H-Set 1 (16QAM version) specified in Annex A7.1.1, with the addition of the parameters in Table 7.3E, and the downlink physical channel setup according to table C.8, applied to both cells simultaneously. Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 7.3F.

| Parameter                                                                                                                                                                                                                                                                                                            | Unit         | Value                                                               |

## 7.4.3.2 Additional requirement for 64QAM

The additional requirements are specified in terms of a minimum information throughput per cell R with the DL reference channel H-Set 8 specified in Annex A7.1.8, with the addition of the parameters in Table 7.3G, and the downlink physical channel setup according to table C.8, applied to both cells simultaneously. Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 7.3H.

| Parameter                                                                                                                                                                             | Unit         | Value   |

# 7.4.4 Additional requirement for single band/dual band 4C-HSDPA or single band 8C-HSDPA and single band NC-4C-HSDPA

## 7.4.4.1 Additional requirement for 16QAM

The additional requirements are specified in terms of a minimum information throughput per cell R with the DL reference channel H-Set 1 (16QAM version) specified in Annex A7.1.1, with the addition of the parameters in Table 7.3I, and the downlink physical channel setup according to table C.8, applied to all the cells simultaneously. Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 7.3J.

| Parameter                                                                                                                                                                                                                                                                                                     | Unit     | Value                                                     |

## 7.4.4.2 Additional requirement for 64QAM

The additional requirements are specified in terms of a minimum information throughput per cell R with the DL reference channel H-Set 8 specified in Annex A7.1.8, with the addition of the parameters in Table 7.3K, and the downlink physical channel setup according to table C.8, applied to all the cells simultaneously. Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 7.3L.

## 7.5 Adjacent Channel Selectivity (ACS)

Adjacent Channel Selectivity (ACS) is a measure of a receiver"s ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an adjacent channel signal at a given frequency offset from the centre frequency of

the assigned channel. ACS is the ratio of the receive filter attenuation on the assigned channel frequency to the receive filter attenuation on the adjacent channel(s).

## 7.5.1 Minimum requirement

The UE shall fulfill the minimum requirement specified in Table 7.4 for all values of an adjacent channel interferer up to -25 dBm.

However it is not possible to directly measure the ACS, instead the lower and upper range of test parameters are chosen in Table 7.5 where the BER shall not exceed 0.001.

## 7.5.2 Additional requirement for DC-HSDPA and DB-DC-HSDPA

The UE shall fulfill the additional requirement specified in Table 7.5A for all values of an adjacent channel interferer up to -25 dBm.

However it is not possible to directly measure the ACS, instead the lower and upper range of test parameters are chosen in Table 7.5B, where the HS-PDSCH BLER shall not exceed 0.1.

## 7.5.3 Additional requirement for single band/dual band 4C-HSDPA

The UE shall fulfill the additional requirement specified in Table 7.5C for all values of an adjacent channel interferer up to -25 dBm.

However it is not possible to directly measure the ACS, instead the lower and upper range of test parameters are chosen in Table 7.5D and the requirements are given in Table 7.5E and Table 7.5EA for single band 4C-HSDPA and in 7.5F and 7.5G for dual band 4C-HSDPA, where the HS-PDSCH BLER shall not exceed 0.1.

The ACS requirement for single band/dual-band 4C-HSDPA is not applicable for dual uplink operation.

#### Table 7.5C: Adjacent Channel Selectivity

| Rx Parameter | Unit | Number of adjacent downlink carriers in a band |    |    |    |
|--------------|------|------------------------------------------------|----|----|----|
|              |      | 1                                              | 2  | 3  | 4  |
| ACS          | dB   | 33                                             | 33 | 33 | 33 |

| Table 7.5D: Test parameters | for Adjacent | Channel Selectivity |

NOTE: <REFSENS> and <REF $\hat{l}_{or}$ > refers to the HS-PDSCH\_Ec<REFSENS> and the HS-PDSCH<REF $\hat{l}_{or}$ > as specified in Table 7.2D for dual band 4C-HSDPA.

## 7.5.4 Additional requirement for single band 8C-HSDPA

The UE shall fulfill the additional requirement specified in Table 7.5H for all values of an adjacent channel interferer up to -25 dBm.

However it is not possible to directly measure the ACS, instead the lower and upper range of test parameters are chosen in Table 7.5I and the requirements are given in Table 7.5J and Table 7.5K where the HS-PDSCH BLER shall not exceed 0.1.

The ACS requirement for single band 8C-HSDPA is not applicable for dual uplink operation.

| Rx Parameter | Unit | Number of adjacent downlink carriers in a band |    |    |    |       |       |       |      |
|--------------|------|------------------------------------------------|----|----|----|-------|-------|-------|------|
|              |      | 1                                              | 2  | 3  | 4  | 5     | 6     | 7     | 8    |
| ACS          | dB   | 33                                             | 33 | 33 | 33 | [TBD] | [TBD] | [TBD] | [33] |

## 7.5.5 Additional requirement for single band NC-4C-HSDPA

The UE shall fulfill the additional requirement specified in Table 7.5L for all values of an adjacent channel interferer up to -25 dBm.

However it is not possible to directly measure the ACS, instead the lower and upper range of test parameters are chosen in Table 7.5M and the requirements are given in Table 7.5N and Table 7.5P where the HS-PDSCH BLER shall not exceed 0.1.

The ACS requirement for single band NC-4C-HSDPA is not applicable for dual uplink operation.

#### Table 7.5L: Adjacent Channel Selectivity

| Rx Parameter | Unit | Number of adjacent downlink carriers in a band |    |    |  |  |
|--------------|------|------------------------------------------------|----|----|--|--|
|              |      | 1                                              | 2  | 3  |  |  |

Table 7.5P: Single band NC-4C-HSDPA requirements for Adjacent Channel Selectivity, Case 2

## 7.6 Blocking characteristics

The blocking characteristic is a measure of the receiver's ability to receive a wanted signal at its assigned channel frequency in the presence of an unwanted interferer on frequencies other than those of the spurious response or the adjacent channels, without this unwanted input signal causing a degradation of the performance of the receiver beyond a specified limit. The blocking performance shall apply at all frequencies except those at which a spurious response occur.

## 7.6.1 Minimum requirement (In-band blocking)

The BER shall not exceed 0.001 for the parameters specified in Table 7.6. In-band blocking is defined for an unwanted interfering signal falling into the UE receive band or into the first 15 MHz below or above the UE receive band.

## Table 7.6: In-band blocking

NOTE 4: The UE transmitted mean power shall be reduced by 0.5dB for a UE operating in band XXII.

# 7.6.1A Additional requirement for DC-HSDPA and DB-DC-HSDPA (In-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.6A. In-band blocking is defined for an unwanted interfering signal falling into the UE receive band or into the first 15 MHz below or above the UE receive band.

HSDPA.

Table 7.6A: In-band blocking for DC-HSDPA and DB-DC-HSDPA

NOTE 5: The UE transmitted mean power shall be reduced by 0.5dB for a UE operating in band XXII.

## 7.6.1B Additional requirement for DC-HSUPA (In-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.6B and Table 7.6C. In-band blocking is defined for an unwanted interfering signal falling into the UE receive band or into the first 15 MHz below or above the UE receive band.

Table 7.6C: Reference input powers for in-band blocking, DC-HSUPA.

# 7.6.1C Additional requirement for single band 4C-HSDPA (In-band blocking)

## 7.6.1C.1 Single uplink operation

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.6D and Table 7.6E. In-band blocking is defined for an unwanted interfering signal falling into the UE receive band or into the first 15 MHz below or above the UE receive band.

## Table 7.6D: Test parameters for in-band blocking, single band 4C-HSDPA, single uplink operation

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                      | Unit    | Level                                                     |                          |  |

## 7.6.1C.2 Dual uplink operation

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.6F and Table 7.6G. In-band blocking is defined for an unwanted interfering signal falling into the UE receive band or into the first 15 MHz below or above the UE receive band.

Table 7.6F: Test parameters for in-band blocking, single band 4C-HSDPA, dual uplink operation

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                 | Unit | Level             |                          |  |

Table 7.6I: In-band blocking requirements, dual band 4C-HSDPA, single uplink operation

#### 7.6.1D.2 Dual uplink operation

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.6J and Table 7.6K. In-band blocking is defined for an unwanted interfering signal falling into the UE receive band or into the first 15 MHz below or above the UE receive band.

| Parameter                                                                                                                                                                      | Unit                                                                                                                                                                                                                                                       | Lev               | rel                      |  |  |  |  |

#### Table 7.6K: In-band blocking requirements, dual band 4C-HSDPA, dual uplink operation

110

## 7.6.1E Additional requirement for single band 8C-HSDPA (In-band blocking)

#### 7.6.1E.1 Single uplink operation

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.6L and Table 7.6M. In-band blocking is defined for an unwanted interfering signal falling into the UE receive band or into the first 15 MHz below or above the UE receive band.

#### Table 7.6L: Test parameters for in-band blocking, single band 8C-HSDPA, single uplink operation

| Parameter                                                                                                                                                                                                                                                                                                                                                                | Unit | Lev                                                       | el                       |  |  |

NOTE 2       For the UE which supports dual band 4C-HSDPA configuration in Table 5.0aC the < HS-PDSCH_Ec > and < Î <sub>or</sub> > are allowed to be increased by an amount defined in Table 5.0aC the < HS-PDSCH_Ec > and < Î <sub>or</sub> > are allowed to be increased by an amount defined in Table 5.0aC the < HS-PDSCH_Ec > and < Î <sub>or</sub> > are allowed to be increased by an amount defined in Table 5.0aC the < HS-PDSCH_Ec > and < Î <sub>or</sub> > are allowed to be increased by an amount defined in Table 7.13. |            |                              |                                  |                                                           |                                |

## 7.6.1F Additional requirement for single band NC-4C-HSDPA (In-band blocking)

#### 7.6.1F.1 Single uplink operation

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.6P and Table 7.6Q. In-band blocking is defined for an unwanted interfering signal falling into the UE receive band or into the first 15 MHz below or above the UE receive band.

#### 7.6.2 Minimum requirement (Out-of-band blocking)

The BER shall not exceed 0.001 for the parameters specified in Table 7.7. Out-of-band blocking is defined for an unwanted interfering signal falling more than 15 MHz below or above the UE receive band.

For Table 7.7 in frequency range 1, 2 and 3, up to 24 exceptions are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable.

For Table 7.7 in frequency range 4, up to 8 exceptions are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable

|                      | subclause 7.5.1 and subclause 7.6.1 shall be applied.                                                                                                          |  |  |  |  |  |
| Band VIII operation  | For 910 $\leq$ f $\leq$ 975 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause                                                 |  |  |  |  |  |
|                      | 7.5.1 and subclause 7.6.1 shall be applied.                                                                                                                    |  |  |  |  |  |
| Band IX operation    | For 1829.9≤f≤ 1894.9 MHz, the appropriate in-band blocking or adjacent channel selectivity in                                                                  |  |  |  |  |  |
|                      | subclause 7.5.1 and subclause 7.6.1 shall be applied.                                                                                                          |  |  |  |  |  |
| Band X operation     | For 2095≤f ≤2185 MHz, the appropriate in-band blocking or adjacent channel selectivity in                                                                      |  |  |  |  |  |
|                      | subclause 7.5.1 and subclause 7.6.1 shall be applied.                                                                                                          |  |  |  |  |  |
| Band XI              | For 1460.9≤f≤ 1510.9 MHz, the appropriate in-band blocking or adjacent channel selectivity in                                                                  |  |  |  |  |  |
| operation            | subclause 7.5.1 and subclause 7.6.1 shall be applied.                                                                                                          |  |  |  |  |  |
| Band XII             | For 714 $\leq$ f $\leq$ 761 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause                                                 |  |  |  |  |  |
| operation            | 7.5.1 and subclause 7.6.1 shall be applied.                                                                                                                    |  |  |  |  |  |
| Band XIII            | For 731 $\leq$ f $\leq$ 771 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause                                                 |  |  |  |  |  |
| operation            | 7.5.1 and subclause 7.6.1 shall be applied.                                                                                                                    |  |  |  |  |  |
| Band XIV             | For $743 \le f \le 783$ MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause                                                     |  |  |  |  |  |
| operation            | 7.5.1 and subclause 7.6.1 shall be applied.                                                                                                                    |  |  |  |  |  |
| Band XIX operation   | For 860≤f≤905 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause                                                               |  |  |  |  |  |
|                      | 7.5.1 and subclause 7.6.1 shall be applied.                                                                                                                    |  |  |  |  |  |
| Band XX operation    | For 776≤f≤836 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause                                                               |  |  |  |  |  |
|                      | 7.5.1 and subclause 7.6.1 shall be applied.                                                                                                                    |  |  |  |  |  |
| Band XXI operation   | For 1480.9≤f ≤1525.9 MHz, the appropriate in-band blocking or adjacent channel selectivity in                                                                  |  |  |  |  |  |
|                      | subclause 7.5.1 and subclause 7.6.1 shall be applied.                                                                                                          |  |  |  |  |  |
| Band XXII operation  | For $3495 \le f \le 3605$ MHz, the appropriate in-band blocking or adjacent channel selectivity in                                                             |  |  |  |  |  |
|                      | subclause 7.5.1 and subclause 7.6.1 shall be applied. NOTE 3                                                                                                   |  |  |  |  |  |
| Band XXV operation   | For 1915≤f ≤2010 MHz, the appropriate in-band blocking or adjacent channel selectivity in                                                                      |  |  |  |  |  |
|                      | subclause 7.5.1 and subclause 7.6.1 shall be applied                                                                                                           |  |  |  |  |  |
| Band XXVI operation  | For 844≤f≤909 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause                                                               |  |  |  |  |  |
|                      | 7.5.1 and subclause 7.6.1 shall be applied.                                                                                                                    |  |  |  |  |  |
|                      | and $\langle REF\hat{l}_{or} \rangle$ refer to the DPCH_Ec $\langle REFSENS \rangle$ and the DPCH $\langle REF\hat{l}_{or} \rangle$ as specified in Table 7.2. |  |  |  |  |  |
|                      | hich supports both Band XI and Band XXI operating frequencies, the Out of band blocking is FFS.                                                                |  |  |  |  |  |
| NOTE 3: The UE trans | mitted mean power shall be reduced by 0.5dB for a UE operating in band XXII.                                                                                   |  |  |  |  |  |
|                      |                                                                                                                                                                |  |  |  |  |  |

#### 7.6.2A Additional requirement for DC-HSDPA (Out-of-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.7AA. Out-ofband band blocking is defined for an unwanted interfering signal falling more than 15 MHz below or above the UE receive band.

For Table 7.7AA in frequency range 1, 2 and 3, up to 24 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable.

For Table 7.7AA in frequency range 4, up to 8 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable.

| operation                   | subclause 7.5.2 and subclause 7.6.1A shall be applied.                                                                                                          |
| Band XII                    | For $714 \le f \le 761$ MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause                                                      |
| operation                   | 7.5.2 and subclause 7.6.1A shall be applied.                                                                                                                    |
| Band XIII                   | For $731 \le f \le 771$ MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause                                                      |
| operation                   | 7.5.2 and subclause 7.6.1A shall be applied.                                                                                                                    |
| Band XIV                    | For $743 \le f \le 783$ MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause                                                      |
| operation                   | 7.5.2 and subclause 7.6.1A shall be applied.                                                                                                                    |
| Band XIX operation          | For 860≤f≤905 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause                                                                |
|                             | 7.5.2 and subclause 7.6.1A shall be applied.                                                                                                                    |
| Band XX operation           | For 776≤f≤836 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause                                                                |
|                             | 7.5.2 and subclause 7.6.1A shall be applied.                                                                                                                    |
| Band XXI operation          | For 1480.9≤f ≤1525.9 MHz, the appropriate in-band blocking or adjacent channel selectivity in                                                                   |
|                             | subclause 7.5.2 and subclause 7.6.1A shall be applied.                                                                                                          |
| Band XXII operation         | For 3495≤ f ≤3605 MHz, the appropriate in-band blocking or adjacent channel selectivity in                                                                      |
|                             | subclause 7.5.2 and subclause 7.6.1A shall be applied. NOTE 3                                                                                                   |
| Band XXV operation          | For 1915≤f ≤2010 MHz, the appropriate in-band blocking or adjacent channel selectivity in                                                                       |
|                             | subclause 7.5.1 and subclause 7.6.1 shall be applied                                                                                                            |
| Band XXVI operation         | For 844≤f≤909 MHz, the appropriate in-band blocking or adjacent channel selectivity in subclause                                                                |
|                             | 7.5.2 and subclause 7.6.1A shall be applied.                                                                                                                    |
| NOTE 1: <refsens></refsens> | and $\langle REF\hat{l}_{or} \rangle$ refer to the DPCH_Ec $\langle REFSENS \rangle$ and the DPCH $\langle REF\hat{l}_{or} \rangle$ as specified in Table 7.2A. |
| NOTE 2: For the UE wh       | nich supports both Band XI and Band XXI operating frequencies, the Out of band blocking is FFS.                                                                 |
| NOTE 3: The UE transi       | mitted mean power shall be reduced by 0.5dB for a UE operating in band XXII.                                                                                    |

#### 7.6.2B Additional requirement for DB-DC-HSDPA (Out-of-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.7AB. Out-ofband blocking is defined for an unwanted interfering signal falling at frequencies outside of frequency regions defined as the UE receive bands extended by 15 MHz at their lower and upper ends. For Table 7.7AB in frequency range 1, 2 and 3, up to 24 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable.

For Table 7.7AB in frequency range 4, up to 8 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable.

| Parameter        | Unit        | Frequency range 1                                                                                  | Frequency range 2                                                                                          | Frequency range 3                  | Frequency range 4                  |

Table 7.7AB: Out of band blocking for DB-DC-HSDPA

## 7.6.2C Additional requirement for single band 4C-HSDPA (Out-of-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.7AC and Table 7.7AD. Out-of-band band blocking is defined for an unwanted interfering signal falling more than 15 MHz below or above the UE receive band. The requirement is not applicable for dual uplink operation.

For Table 7.7AC in frequency range 1, 2 and 3, up to 24 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable.

For Table 7.7AC in frequency range 4, up to 8 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable.

## 7.6.2D Additional requirement for dual band 4C-HSDPA (Out-of-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.7AE and Table 7.7AF. Out-of-band blocking is defined for an unwanted interfering signal falling at frequencies outside of frequency regions defined as the UE receive bands extended by 15 MHz at their lower and upper ends. The requirement is not applicable for dual uplink operation.

For Table 7.7AF in frequency range 1, 2 and 3, up to 24 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable.

For Table 7.7AF in frequency range 4, up to 8 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable.

| Parameter                                                                                                      | Unit                                                                                                                                                                             | Frequency<br>range 1                                          | Frequency<br>range 2                                           | Frequency<br>range 3                          | Frequency<br>range 4             |  |

Table 7.7AF: Out of band blocking requirements, dual band 4C-HSDPA

## 7.6.2E Additional requirement for single band 8C-HSDPA (Out-of-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.7AG and Table 7.7AH. Out-of-band band blocking is defined for an unwanted interfering signal falling more than 15 MHz below or above the UE receive band. The requirement is not applicable for dual uplink operation.

For Table 7.7AG in frequency range 1, 2 and 3, up to 24 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable.

For Table 7.7AG in frequency range 4, up to 8 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 Spurious response are applicable.

## 7.6.2F Additional requirement for single band NC-4C-HSDPA (Out-of-band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.7AI and Table 7.7AJ. Out-of-band band blocking is defined for an unwanted interfering signal falling more than 15 MHz below or above the UE receive band. The requirement is not applicable for dual uplink operation.

For Table 7.7AI in frequency range 1, 2 and 3, up to 24 exceptions per received cell are allowed for spurious response frequencies in each assigned frequency channel when measured using a 1 MHz step size. For these exceptions the requirements of clause 7.7 spurious response are applicable.

Table 7.7AJ: Out of band blocking requirements, single band NC-4C-HSDPA

#### 7.6.3 Minimum requirement (Narrow band blocking)

The BER shall not exceed 0.001 for the parameters specified in Table 7.7A. This requirement is measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an unwanted narrow band interferer at a frequency, which is less than the nominal channel spacing.

| Parameter                                                                                                           | Unit                                                                  | Band II, IV, V, X, XXV,             | Band III, VIII, XII, XIII,          |  |  |  |

Table 7.7A: Narrow band blocking characteristics

## 7.6.3A Additional requirement for DC-HSDPA and DB-DC-HSDPA (Narrow band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.7B. This requirement is measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an unwanted narrow band interferer at a frequency, which is less than the nominal channel spacing.

#### 7.6.3B Additional requirement for DC-HSUPA (Narrow band blocking)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.7C and Table 7.7D. This requirement is measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an unwanted narrow band interferer at a frequency, which is less than the nominal channel spacing.

| Parameter                                                                                                                                                                                                                                                                                                                                     | Unit | Band II, IV, V, X, XXV,<br>XXVI                           | Band III, VIII, XII, XIII,<br>XIV |  |  |

## 7.6.3C Additional requirement for single band 4C-HSDPA (Narrow band blocking)

This requirement is measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an unwanted narrow band interferer at a frequency, which is less than the nominal channel spacing.

#### 7.6.3C.1 Single uplink operation

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.7DA and Table 7.7DB.

### Table 7.7DA: Test parameters for narrow band blocking characteristics, single band 4C-HSDPA, single uplink operation

| Para                                 | meter                                                                                                                                                                                                                                 | Unit | Band II                                                   |  |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|-----------------------------------------------------------|--|

## 7.6.3D Additional requirement for dual band 4C-HSDPA (Narrow band blocking)

This requirement is measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an unwanted narrow band interferer at a frequency, which is less than the nominal channel spacing.

#### 7.6.3D.1 Single uplink operation

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.7E and Table 7.7F.

### Table 7.7E: Test parameters for narrow band blocking characteristics, dual band 4C-HSDPA, single uplink operation

| Para                                 | ameter                                                    | Unit      | Band II, IV, V         | Band VIII         |  |
|--------------------------------------|-----------------------------------------------------------|-----------|------------------------|-------------------|--|

## 7.6.3E Additional requirement for single band NC-4C-HSDPA (Narrow band blocking)

This requirement is measure of a receiver's ability to receive a W-CDMA signal at its assigned channel frequency in the presence of an unwanted narrow band interferer at a frequency, which is less than the nominal channel spacing.

#### 7.6.3E.1 Single uplink operation

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.7I and Table 7.7J.

### Table 7.7I: Test parameters for narrow band blocking characteristics, single band NC-4C-HSDPA, single uplink operation

Table 7.7L: Narrow band blocking requirements, single band NC-4C-HSDPA, dual uplink operation

#### 7.7 Spurious response

#### 7.7.1 Minimum requirement

Spurious response is a measure of the receiver's ability to receive a wanted signal on its assigned channel frequency without exceeding a given degradation due to the presence of an unwanted CW interfering signal at any other frequency at which a response is obtained i.e. for which the out of band blocking limit as specified in subclause 7.6.2 is not met.

The BER shall not exceed 0.001 for the parameters specified in Table 7.8.

| Parameter                                                                                                                                                                                                                                                                                            | Unit         | Level                                                               |  |  |  |

#### Table 7.8: Spurious Response

# 7.7.2 Additional requirement for DC-HSDPA, DB-DC-HSDPA, single band/dual band 4C-HSDPA and single band 8C-HSDPA and single band NC-4C-HSDPA

Spurious response is a measure of the receiver's ability to receive a wanted signal on its assigned channel frequency without exceeding a given degradation due to the presence of an unwanted CW interfering signal at any other frequency at which a response is obtained i.e. for which the out of band blocking limit as specified in subclause 7.6.2A, 7.6.2B, 7.6.2C, 7.6.2D or 7.6.2E or 7.6.2F is not met.

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.8A. The requirement is not applicable for dual uplink operation.

#### Table 7.8A: Spurious Response

#### 7.8 Intermodulation characteristics

Third and higher order mixing of the two interfering RF signals can produce an interfering signal in the band of the desired channel. Intermodulation response rejection is a measure of the capability of the receiver to receiver a wanted signal on its assigned channel frequency in the presence of two or more interfering signals which have a specific frequency relationship to the wanted signal.

#### 7.8.1 Minimum requirement

The BER shall not exceed 0.001 for the parameters specified in Table 7.9.

|------------------------------------------|------------|------------------------------|----------------------------------|------------------------------------|--------------------------------|
| I-8                                      |            | -105                         | -94.7                            | 20 (for Power class 3 and 3bis)    | Minimum                        |

|        | 18 (for Power class 4)                                                                            |
|--------|---------------------------------------------------------------------------------------------------|
| NOTE 1 | For the UE which supports DB-DC-HSDPA configuration in Table 5.0aA the < HS-PDSCH_Ec >            |
|        | and < $\hat{I}_{or}$ > are allowed to be increased by an amount defined in Table 7.12.            |
| NOTE 2 | For the UE which supports dual band 4C-HSDPA configuration in Table 5.0aC the < HS-               |
|        | PDSCH_Ec > and < $\hat{l}_{or}$ > are allowed to be increased by an amount defined in Table 7.13. |

#### 7.8.1F Additional requirement for single band NC-4C-HSDPA

#### 7.8.1F.1 Single uplink operation

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.9AP and Table 7.9AQ.

### Table 7.9AP: Test parameters for receive intermodulation characteristics, single band NC-4C-HSDPA, single uplink operation

| Parameter                                                                                | Unit                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Le                                                        | vel |  |

| power       18 (for Power class 4)         NOTE 1:       Iouw2 (GMSK) is an interfering signal as defined in TS 45.004 [6].         NOTE 2:       For DC-HSDPA, negative offset refers to the assigned channel frequency of the lowest carrier frequency used and positive offset refers to the assigned channel frequency of the highest carrier frequency used. For DB-DC-HSDPA, offset refers to the assigned channel frequency of the individual cells.         NOTE3: <refsens> and <refî<sub>or&gt; refers to the HS-PDSCH_Ec<refsens> and the HS-PDSCH         PDSCH<refî<sub>or&gt; as specified in Table 7.2A for DC-HSDPA and Table 7.2B for DB-DC-HSDPA.</refî<sub></refsens></refî<sub></refsens> |        |              |                                                                                                          |           |                                                 |            |

#### Table 7.9B: Receive intermodulation characteristics

#### 7.8.2B Additional requirement for DC-HSUPA (Narrow band)

The BLER measured on each individual cell shall not exceed 0.1 for the parameters specified in Table 7.9C and Table 7.9D.

## 7.9 Spurious emissions

The spurious emissions power is the power of emissions generated or amplified in a receiver that appear at the UE antenna connector. The spurious emission is verified per antenna connector with the other(s) terminated.

## 7.9.1 Minimum requirement

The power of any narrow band CW spurious emission shall not exceed the maximum level specified in Table 7.10 and Table 7.11

| Frequency Band                                                                                            | Measurement<br>Bandwidth | Maximum<br>level | Note   |  |  |

## 7.10 Reference input power adjustment for a dual band device

For the UE which supports DB-DC-HSDPA configuration in Table 5.0aA, the reference input powers (HS-PDSCH\_Ec and  $\hat{l}_{or}$ ) of core requirements specified in subclause 7.6.1B, 7.6.1C.2, 7.6.3B, 7.8.1B, 7.8.1C.2, and 7.8.2B are allowed to be increased by the amount given in Table 7.12 for the applicable bands.

| Table 7.12: Allowed increase of HS-PDSCH Ec ar |  |
|------------------------------------------------|--|
|                                                |  |
|                                                |  |
|                                                |  |
|                                                |  |

| DB-DC-HSDPA<br>Configuration | Allowed increase of HS-PDSCH Ec and $\hat{I}_{or}$ (dB) | Applicable bands |
|------------------------------|---------------------------------------------------------|------------------|
| 1                            | 0.5                                                     | I, VIII          |
| 2                            | 1                                                       | II, IV           |
| 3                            | 0.5                                                     | I, V             |
| 4                            | 1                                                       | I, XI            |
| 5                            | 0.5                                                     | II, V            |

For the UE which supports dual band 4C-HSDPA configuration in Table 5.0aC, the reference input powers (HS-PDSCH\_Ec and  $\hat{l}_{or}$ ) of core requirements specified in subclause 7.6.1B, 7.6.1C.2, 7.6.3B, 7.8.1B, 7.8.1C.2, and 7.8.2B are allowed to be increased by the amount given in Table 7.13 for the applicable bands.

Table 7.13: Allowed increase of HS-PDSCH Ec and  $\hat{I}_{or}$  for UE which supports dual band 4C-HSDPA.

## 8 Performance requirement

## 8.1 General

The performance requirements for the UE in this subclause are specified for the measurement channels specified in Annex A, the propagation conditions specified in Annex B and the Down link Physical channels specified in Annex C. Unless stated DL power control is OFF. Unless otherwise stated the performance requirements are specified at the antenna connector of the UE. For UE(s) with an integral antenna only, a reference antenna with a gain of 0 dBi is assumed. UE with an integral antenna may be taken into account by converting these power levels into field strength requirements, assuming a 0 dBi gain antenna. For UE(s) with more than one receiver antenna connector the fading of the signals and the AWGN signals applied to each receiver antenna connector shall be uncorrelated. The levels of the test signal applied to each of the antenna connectors shall be as defined in the respective sections below.

For a UE which supports optional enhanced performance requirements type1 for DCH and an alternative requirement is specified, the UE shall meet only the enhanced performance requirement type1. For those cases where the enhanced performance requirements shall apply.

## 8.2 Demodulation in static propagation conditions

- 8.2.1 (void)
- 8.2.2 (void)

## 8.2.3 Demodulation of Dedicated Channel (DCH)

The receive characteristic of the Dedicated Channel (DCH) in the static environment is determined by the Block Error Ratio (BLER). BLER is specified for each individual data rate of the DCH. DCH is mapped into the Dedicated Physical Channel (DPCH).

#### 8.2.3.1 Minimum requirement

For the parameters specified in Table 8.5 the average downlink  $\underline{DPCH \_ E_c}_{I_{or}}$  power ratio shall be below the specified

value for the BLER shown in Table 8.6. These requirements are applicable for TFCS size 16.

| Parameter             | Unit         | Test 1 | Test 2 | Test 3 | Test 4 |

# 8.3 Demodulation of DCH in multi-path fading propagation conditions

### 8.3.1 Single Link Performance

The receive characteristics of the Dedicated Channel (DCH) in different multi-path fading environments are determined by the Block Error Ratio (BLER) values. BLER is measured for the each of the individual data rate specified for the DPCH. DCH is mapped into in Dedicated Physical Channel (DPCH).

#### 8.3.1.1 Minimum requirement

 $I_{oc}$ 

Information Data Rate

For the parameters specified in Table 8.7, 8.9, 8.11, 8.13 and 8.14A the average downlink  $\frac{DPCH_{E_c}}{I_{or}}$  power ratio shall

be below the specified value for the BLER shown in Table 8.8, 8.10, 8.12, 8.14 and 8.14B. If the UE supports optional enhanced performance requirements type1 for DCH then for the parameters specified in Table 8.10A the average downlink  $\underline{DPCH}_{-E_c}$  power ratio shall be below the specified value for the BLER shown in 8.10B, and Test 5, Test 6  $I_{er}$ 

and Test 8 shall be replaced by Test 5a, Test 6a and Test 8a. These requirements are applicable for TFCS size 16.

## 8.4 Demodulation of DCH in moving propagation conditions

### 8.4.1 Single link performance

The receive single link performance of the Dedicated Channel (DCH) in dynamic moving propagation conditions are determined by the Block Error Ratio (BLER) values. BLER is measured for the each of the individual data rate specified for the DPCH. DCH is mapped into Dedicated Physical Channel (DPCH).

#### 8.4.1.1 Minimum requirement

For the parameters specified in Table 8.15 the average downlink  $\frac{DPCH - E_c}{I_{or}}$  power ratio shall be below the specified

value for the BLER shown in Table 8.16.

| Ī | Parameter             | Unit         | Test 1  | Test 2 |
|---|-----------------------|--------------|---------|--------|
|   | Phase reference       |              | P-CPICH |        |

## 8.5 Demodulation of DCH in birth-death propagation conditions

### 8.5.1 Single link performance

The receive single link performance of the Dedicated Channel (DCH) in dynamic birth-death propagation conditions are determined by the Block Error Ratio (BLER) values. BER is measured for the each of the individual data rate specified for the DPCH. DCH is mapped into Dedicated Physical Channel (DPCH).

#### 8.5.1.1 Minimum requirement

For the parameters specified in Table 8.17 the average downlink  $\underline{DPCH_{-}E_{c}}$  power ratio shall be below the specified  $I_{or}$ 

value for the BLER shown in Table 8.18.

| Parameter             | Unit         | Test 1  | Test 2 |
|-----------------------|--------------|---------|--------|
| Phase reference       |              | P-CPICH |        |
| $\hat{I}_{or}/I_{oc}$ | dB           | -1      |        |

## 8.5A Demodulation of DCH in high speed train condition

### 8.5A.1 General

The receiver performance of the DCH in high speed train condition is determined by the BLER values. BLER is measured for the individual data rate specified for the DPCH. DCH is mapped into DPCH.

### 8.5A.2 Minimum requirement

For the parameters specified in Table 8.18A the average downlink  $\frac{DPCH_{-}E_{c}}{I_{or}}$  power ratio shall be below the specified

value for the BLER shown in Table 8.18B.

#### Table 8.18A: DCH parameters in high speed train condition

| Parameter             | Unit         | Test 1  |
|-----------------------|--------------|---------|
| Phase reference       |              | P-CPICH |

## 8.7 Demodulation in Handover conditions

### 8.7.1 Demodulation of DCH in Inter-Cell Soft Handover

The bit error rate characteristics of UE is determined during an inter-cell soft handover. During the soft handover a UE receives signals from different cells. A UE has to be able to demodulate two PCCPCH channels and to combine the energy of DCH channels. Delay profiles of signals received from different cells are assumed to be the same but time shifted by 10 chips.

The receive characteristics of the different channels during inter-cell handover are determined by the average Block Error Ratio (BLER) values.

#### 8.7.1.1 Minimum requirement

For the parameters specified in Table 8.25 the average downlink  $\frac{DPCH - E_c}{I_{or}}$  power ratio shall be below the specified

value for the BLER shown in Table 8.26. If the UE supports optional enhanced performance requirements type1 for DCH then for the parameters specified in Table 8.26A the average downlink  $\frac{DPCH_{-}E_{c}}{I_{cr}}$  power ratio shall be below the

specified value for the BLER shown in Table 8.26B and Test 1 shall be replaced by Test 1a.

# 8.7.2 Combining of TPC commands from radio links of different radio link sets

#### 8.7.2.1 Minimum requirement

Test parameters are specified in Table 8.27. The delay profiles of the signals received from the different cells are the same but time-shifted by 10 chips.

For Test 1, the sequence of uplink power changes between adjacent slots shall be as shown in Table 8.28 over the 4 consecutive slots more than 99% of the time. Note that this case is without an additional noise source  $I_{oc}$ .

For Test 2, the Cell1 and Cell2 TPC patterns are repeated a number of times. If the transmitted power of a given slot is increased compared to the previous slot, then a variable "Transmitted power UP" is increased by one, otherwise a variable "Transmitted power DOWN" is increased by one. The requirements for "Transmitted power UP" and "Transmitted power DOWN" are shown in Table 8.28A.

| Parameter Unit                            |              | Test 1               | Test 2            |

#### Table 8.28A: Requirements for Test 2

# 8.7.3 Combining of reliable TPC commands from radio links of different radio link sets

#### 8.7.3.1 Minimum requirement

Test 1 verifies that the UE follows only the reliable TPC commands in soft handover. Test 2 verifies that the UE follows all the reliable TPC commands in soft handover.

Test parameters are specified in Table 8.28B. Before the start of the tests, the UE transmit power shall be initialised to -15 dBm. An actual UE transmit power may vary from the target level of -15 dBm due to inaccurate UE output power step.

During tests 1 and 2 the UE transmit power samples, which are defined as the mean power over one timeslot, shall stay 90% of the time within the range defined in Table 8.28C.

| Parameter                   | Unit                                                                        | Test 1                   | Test 2           |  |  |

#### Table 8.28C: Test requirements for reliable TPC command combining

| Parameter       | Unit | Test 1     | Test 2     |
|-----------------|------|------------|------------|
| UE output power | dBm  | -15 ± 5 dB | -15 ± 3 dB |

## 8.8 Power control in downlink

Power control in the downlink is the ability of the UE receiver to converge to required link quality set by the network while using as low power as possible in downlink. If a BLER target has been assigned to a DCCH (See Annex A.3), then it has to be such that outer loop is based on DTCH and not on DCCH.

The requirements in this subclause were derived with the assumption that the UTRAN responds immediately to the uplink TPC commands by adjusting the power of the first pilot field of the DL DPCCH that commences after end of the received TPC command.

### 8.8.1 Power control in the downlink, constant BLER target

#### 8.8.1.1 Minimum requirements

For the parameters specified in Table 8.29 the downlink  $\frac{DPCH_{-}E_{c}}{I_{or}}$  power ratio measured values, which are averaged

over one slot, shall be below the specified value in Table 8.30 more than 90% of the time. BLER shall be as shown in Table 8.30. If the UE supports optional enhanced performance requirements type1 for DCH then for the parameters specified in Table 8.30A the downlink  $\frac{DPCH_{-}E_{c}}{I_{or}}$  power ratio measured values, which are averaged over one slot, shall

be below the specified value in Table 8.30B more than 90% of the time. BLER shall be as shown in Table 8.30B and Test 2 shall be replaced by Test 2a. Power control in downlink is ON during the test.

#### Table 8.29: Test parameter for downlink power control

| Parameter                        | Unit         | Test 1     | Test 2 | Test 3 | Test 4 |

| Measured quality on<br>DTCH | BLER | 0.01±30% |

#### 8.8.2 Power control in the downlink, initial convergence

This requirement verifies that DL power control works properly during the first seconds after DPCH connection is established

#### 8.8.2.1 Minimum requirements

For the parameters specified in Table 8.31 the downlink DPCH\_Ec/Ior power ratio measured values, which are averaged over 50 ms, shall be within the range specified in Table 8.32 more than 90% of the time. For UE supporting the enhanced performance requirements type1 for DCH with the parameters specified in Table 8.32A the downlink DPCH\_Ec/Ior power ratio measured values, which are averaged over 50 ms, shall be within the range specified in Table 8.32B more than 90% of the time. T1 equals to 500 ms and it starts 10 ms after the DPDCH physical channel is considered established and the first uplink frame is transmitted. T2 equals to 500 ms and it starts when T1 has expired. Power control is ON during the test. If the UE supports optional enhanced performance requirements type1 for DCH, Test 1, Test 2, Test 3 and Test 4 shall be replaced by Test 1a, Test 2a, Test 3a and Test 4a.

The first 10 ms shall not be used for averaging, ie the first sample to be input to the averaging filter is at the beginning of T1. The averaging shall be performed with a sliding rectangular window averaging filter. The window size of the averaging filter is linearly increased from 0 up to 50 ms during the first 50 ms of T1, and then kept equal to 50 ms.

| Parameter                        | Unit            | Test 1 | Test 2 | Test 3 | Test 4 |

## 8.8.3 Power control in downlink, wind up effects

#### 8.8.3.1 Minimum requirements

This test is run in three stages where stage 1 is for convergence of the power control loop. In stage two the maximum downlink power for the dedicated channel is limited not to be higher than the value specified in Table 8.33. All parameters used in the three stages are specified in Table 8.33. The downlink  $\underline{DPCH}_{-E_c}$  power ratio measured values,  $I_{or}$ 

which are averaged over one slot, during stage 3 shall be lower than the value specified in Table 8.34 more than 90% of the time.

Power control of the UE is ON during the test.

| Deremeter                                                                                                    | llmit                           |                                  | Test 1                   |              |  |

### 8.8.4 Power control in the downlink, different transport formats

#### 8.8.4.1 Minimum requirements

Test 1 verifies that UE outer loop power control has proper behaviour with different transport formats.

The downlink reference measurement channel used in this subclause shall have two different transport formats. The different transport formats of the downlink reference measurement channel used shall correspond to the measurement channels specified in Annex A.3.0 and A.3.1. The transport format used in downlink reference measurement channel during different stages of the test shall be set according to the information data rates specified in Table 8.34A. During stage 1 a downlink transport format combination using the 12.2kbps information data rate DTCH shall be used, and during stage 2 the downlink transport format combination shall be changed such that a 0kbps information data rate transport format combination is then used.

For the parameters specified in Table 8.34A the downlink  $\frac{DPCH \_ E_c}{I_{or}}$  power ratio measured values, which are averaged

over one slot, shall be below the specified value in Table 8.34B more than 90% of the time. BLER shall be as shown in Table 8.34B. Power control in downlink is ON during the test.

### 8.8.5 Power control in the downlink for F-DPCH

#### 8.8.5.1 Minimum requirements

For the parameters specified in Table 8.34C the downlink  $\frac{F - DPCH - E_c}{I_{or}}$  power ratio measured values, which are averaged over TPC symbols of the F-DPCH frame, shall be below the specified value in Table 8.34D more than 90% of

the time. TPC command error ratio shall be in the limits given by Table 8.34D. Power control in downlink is ON during the tests.

## 8.9 Downlink compressed mode

Downlink compressed mode is used to create gaps in the downlink transmission, to allow the UE to make measurements on other frequencies.

The requirements in this subclause were derived with the assumption that the UTRAN responds immediately to the uplink TPC commands by adjusting the power of the first pilot field of the DL DPCCH that commences after end of the received TPC command.

## 8.9.1 Single link performance

The receiver single link performance of the Dedicated Traffic Channel (DCH) in compressed mode is determined by the Block Error Ratio (BLER) and transmitted DPCH\_Ec/Ior power ratio in the downlink.

The compressed mode parameters are given in clause A.5.

#### 8.9.1.1 Minimum requirements

For the parameters specified in Table 8.35 the downlink <u>DPCH\_E</u> power ratio measured values, which are averaged

Ι...

over one slot, shall be below the specified value in Table 8.36 more than 90% of the time. The measured quality on DTCH shall be as required in Table 8.36.

Downlink power control is ON during the test. Uplink TPC commands shall be error free.

| Parameter                    | Unit         | Test 1                  | Test 2                  |  |

Table 8.36: Requirements in downlink compressed mode

## 8.10 Blind transport format detection

Performance of Blind transport format detection is determined by the Block Error Ratio (BLER) values and by the measured average transmitted DPCH\_Ec/Ior value.

### 8.10.1 Minimum requirement

For the parameters specified in Table 8.37 the average downlink  $\frac{DPCH - E_c}{I_{or}}$  power ratio shall be below the specified value for the BLER shown in Table 8.38.

Table 8.37: Test parameters for Blind transport format detection

## 8.11 Detection of Broadcast channel (BCH)

The receiver characteristics of Broadcast Channel (BCH) are determined by the Block Error Ratio (BLER) values. BCH is mapped into the primary common control physical channel (P-CCPCH).

### 8.11.1 Minimum requirement without transmit diversity

For the parameters specified in Table 8.40 the average downlink power P-CCPCH\_Ec/Ior shall be below the specified value for the BLER shown in Table 8.41. (The Down link Physical channels are specified in Annex C).

This requirement doesn"t need to be tested.

| Parameter             | Unit         | Test 1  | Test 2 |
|-----------------------|--------------|---------|--------|
| Phase reference       | -            | P-CPICH |        |
| I <sub>oc</sub>       | dBm/3.84 MHz | -60     | 0      |
| $\hat{I}_{or}/I_{oc}$ | dB           | -1      | -3     |
| Propagation condition |              | Static  | Case 3 |

#### Table 8.40: Parameters for BCH detection

#### Table 8.41: Test requirements for BCH detection

| Test Number | P-CCPCH_Ec/lor | BLER |
|-------------|----------------|------|
| 1           | -18.5 dB       | 0.01 |
| 2           | -12.8 dB       | 0.01 |

### 8.11.2 Minimum requirement with open loop transmit diversity

For the parameters specified in Table 8.41A the average downlink power P-CCPCH\_Ec/Ior shall be below the specified value for the BLER shown in Table 8.41B. (The Down link Physical channels are specified in Annex C).

This requirement doesn"t need to be tested.

## Table 8.41A: Test parameters for BCH detection in an open loop transmit diversity scheme (STTD). (Propagation condition: Case 1)

| Parameter             | Unit         | Test 3  |

| I <sub>oc</sub>       | dBm/3.84 MHz | -60     |
| $\hat{I}_{or}/I_{oc}$ | dB           | 9       |

Table 8.41B: Test requirements for BCH detection in open loop transmit diversity scheme

| Test Number | P-CCPCH_Ec/lor<br>(Total power from<br>antenna 1 and 2) | BLER |
|-------------|---------------------------------------------------------|------|
| 3           | -18.5                                                   | 0.01 |

## 8.12 Demodulation of Paging Channel (PCH)

The receiver characteristics of paging channel are determined by the probability of missed paging message (Pm-p). PCH is mapped into the S-CCPCH and it is associated with the transmission of Paging Indicators (PI) to support efficient sleep-mode procedures.

#### 8.12.1 Minimum requirement

For the parameters specified in Table 8.42 the average probability of missed paging (Pm-p) shall be below the specified value in Table 8.43. Power of downlink channels other than S-CCPCH and PICH are as defined in Table C.3 of Annex C. S-CCPCH structure is as defined in Annex A.6.

| Parameter                                     | Unit         | Test 1 | Test 2 |
|-----------------------------------------------|--------------|--------|--------|
| Number of paging<br>indicators per frame (Np) | -            | 72     | 2      |
| Phase reference                               | -            | P-CP   | ICH    |
| I <sub>oc</sub>                               | dBm/3.84 MHz | -60    | )      |
| $\hat{I}_{or}/I_{oc}$                         | dB           | -1     | -3     |
| Propagation condition                         |              | Static | Case 3 |

#### Table 8.42: Parameters for PCH detection

| Test Number | S-CCPCH_Ec/lor | PICH_Ec/lor | Рт-р |
|-------------|----------------|-------------|------|
| 1           | -14.8          | -19         | 0.01 |
| 2           | -9.8           | -12         | 0.01 |

## 8.13 Detection of Acquisition Indicator (AI)

The receiver characteristics of Acquisition Indicator (AI) are determined by the probability of false alarm Pfa and probability of correct detection Pd. Pfa is defined as a conditional probability of detection of AI signature given that a AI signature was not transmitted. Pd is defined as a conditional probability of correct detection of AI signature given that the AI signature is transmitted.

### 8.13.1 Minimum requirement

For the parameters specified in Table8.44 the Pfa and 1-Pd shall not the exceed the specified values in Table 8.45. Power of downlink channels other than AICH is as defined in Table C.3 of Annex C.

| Parameter                                               | Unit         | Test 1  |
|---------------------------------------------------------|--------------|---------|
| Phase reference                                         | -            | P-CPICH |
| I <sub>oc</sub>                                         | dBm/3.84 MHz | -60     |
| Number of other<br>transmitted AI<br>signatures on AICH | -            | 0       |
| $\hat{I}_{or}/I_{oc}$                                   | dB           | -1      |
| AICH_Ec/lor                                             | dB           | -22.0   |
| AICH Power Offset                                       | dB           | -12.0   |
| Propagation<br>condition                                | -            | Static  |

| Table 8.44: Parameters for AI detection | n |
|-----------------------------------------|---|
|-----------------------------------------|---|

Note that AICH\_Ec/Ior can not be set. Its value is calculated from other parameters and it is given for information only. (AICH\_Ec/Ior = AICH Power Offset + CPICH\_Ec/Ior)

|-------------|------|------|
| 1           | 0.01 | 0.01 |

## 8.13A Detection of E-DCH Acquisition Indicator (E-AI)

The receiver characteristics of E-DCH Acquisition Indicator (E-AI) are determined by the probability of correct detection Pde. Pde is defined as a conditional probability of correct detection of E-AI signature given that the E-AI signature is transmitted and AI signature was correctly received.

### 8.13A.1 Minimum requirement

For the parameters specified in Table 8.45C the 1-Pde shall not exceed the specified value in Table 8.45D. The power settings for downlink channels other than AICH and E-AICH are set as defined in Table C.3 of Annex C.

| Parameter                                                    | Unit         | Test 1  |
|--------------------------------------------------------------|--------------|---------|
| Phase reference                                              | -            | P-CPICH |
| I <sub>oc</sub>                                              | dBm/3.84 MHz | -60     |
| Number of other<br>transmitted AI<br>signatures on AICH      | -            | 0       |
| Number of<br>resources assumed<br>for E-DCH random<br>access | -            | 32      |
| $\hat{I}_{or}/I_{oc}$                                        | dB           | -1      |
| AICH_Ec/lor                                                  | dB           | -22.0   |
| AICH Power Offset                                            | dB           | -12.0   |
| E-AICH_Ec/lor                                                | dB           | -22.0   |
| E-AICH Power<br>Offset                                       | dB           | -12.0   |
| Propagation<br>condition                                     | -            | Static  |

# 8.14 UE UL power control operation with discontinuous UL DPCCH transmission operation

#### 8.14.1 Minimum requirement

This test verifies that the UE follows only those TPC commands that correspond to the UL DPCCH slots which are transmitted.

Test parameters are specified in Table 8.45A. The discontinuous UL DPCCH transmission is enabled during the test. The parameters for discontinuous UL DPCCH transmission operation are as specified in Table A.20A. Before the start of the tests, the UE transmit power shall be initialised to -15 dBm. An actual UE transmit power may vary from the target level of -15 dBm due to inaccurate UE output power step.

After transmission gaps due to discontinuous uplink DPCCH transmission the uplink transmitter power difference shall be within the range as defined in Table 8.45B. The transmit power difference is defined as the difference between the power of the last slot transmitted before the gap and the power of first slot transmitted after the gap. The on power observation period is defined as the mean power over one timeslot excluding any transient periods.

## Table 8.45A: Parameters for UE UL power control operation with discontinuous UL DPCCH transmission

| Parameter                                                                                                                                                                                                             | Unit         | Test 1                              |  |  |

## 9 Performance requirement (HSDPA)

The performance requirements for the UE in this clause apply for the reference measurement channels specified in Annex A.7, the propagation conditions specified in Annex B.2.2 and the Down link Physical channels specified in Annex C.5. The specific references are provided separately for each requirement.

Unless otherwise stated the performance requirements are specified at the antenna connector of the UE. For UE(s) with an integral antenna only, a reference antenna with a gain of 0 dBi is assumed. UE with an integral antenna may be taken into account by converting these power levels into field strength requirements, assuming a 0 dBi gain antenna. For UEs with more than one antenna connector testing the fading of the signals and the AWGN signals applied to each receiver antenna connector shall be uncorrelated. The levels of the test signal applied to each of the antenna connectors shall be as defined in the respective sections below.

## 9.1 (void)

## 9.2 Demodulation of HS-DSCH (Fixed Reference Channel)

The minimum performance requirement for a particular UE supporting one of the HS-DSCH categories 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 or 12 are determined according to Table 9.1.

The minimum performance requirements for a particular UE supporting one of the HS-DSCH categories 1, 2, 3, 4, 5, 6, 7, 8, 9 or 10 and supporting the optional enhanced performance requirements type 1 are determined according to Table 9.1AA.

The minimum performance requirements for a particular UE supporting one of the HS-DSCH categories 7, 8, 9 or 10 and supporting the optional enhanced performance requirements type 2 are determined according to Table 9.1AB.

The minimum performance requirements for a particular UE supporting HS-DSCH category 13 or 14 are determined according to Table 9.1AB.

The minimum performance requirements for a particular UE supporting one of the HS-DSCH categories 7, 8, 9, 10, 13 or 14 and supporting the optional enhanced performance requirements type 3 are determined according to Table 9.1AC.

The minimum performance requirements for a particular UE supporting one of the HS-DSCH categories 15, 16, 17, 18, 19 or 20 are determined according to Table 9.1AC.

The minimum performance requirements for a particular UE supporting one of the HS-DSCH categories 7, 8, 9, 10, 13, 14, 15, 16, 17, 18, 19 or 20 and supporting the optional enhanced performance requirements type 3i are determined according to Table 9.1AD.

The minimum performance requirements for a particular UE supporting one of the HS-DSCH categories 21, 22, 23 and 24 are determined according to Table 9.1 AE.

The minimum performance requirements for a particular UE supporting one of the HS-DSCH categories 21, 22, 23, 24, 25, 26, 27 or 28 and supporting the optional enhanced performance requirements type 3 are determined according to Table 9.1 AF.

The minimum performance requirements for a particular UE supporting one of the HS-DSCH categories 21, 22, 23, 24, 25, 26, 27 or 28 and supporting the optional enhanced performance requirements type 3i are determined according to Table 9.1 AG.

The minimum performance requirements for a particular UE supporting one of the HS-DSCH categories 29 and 31 are determined according to Table 9.1AH.

The minimum performance requirements for a particular UE supporting one of the HS-DSCH categories 29, 30, 31 and 32 and supporting the optional enhanced performance requirements type 3 are determined according to Table 9.1AI.

The minimum performance requirements for a particular UE supporting one of the HS-DSCH categories 29, 30, 31 and 32 and supporting the optional enhanced performance requirements type 3i are determined according to Table 9.1AJ.

The minimum performance requirements for a particular UE supporting HS-DSCH category 35 are determined according to Table 9.1AK.

The minimum performance requirements for a particular UE supporting one of the HS-DSCH categories 35 and 36 and supporting the optional enhanced performance requirements type 3 are determined according to Table 9.1AL.

The minimum performance requirements for a particular UE supporting one of the HS-DSCH categories 35 and 36 and supporting the optional enhanced performance requirements type 3i are determined according to Table 9.1AM.

A UE supporting one of categories 21, 22 23, 24, 29, 31 or 35 shall support either enhanced receiver type 2 requirements, or enhanced receiver type 3 requirements, or enhanced receiver type 3 requirements applicable for the other categories supported by this UE.

A UE supporting one of categories 21, 22 23, 24, 29, 31 or 35 supporting enhanced receiver type 3 requirements shall support either enhanced receiver type 3 requirements, or enhanced receiver type 3 requirements applicable for the other categories supported by this UE.

A UE supporting one of categories 21, 22 23, 24, 29, 31 or 35 supporting enhanced receiver type 3i requirements shall support enhanced receiver type 3i requirements applicable for the other categories supported by this UE.

The additional minimum performance requirements for UE supporting one of the HS-DSCH categories 7, 8, 9, 10, 13, 14, 21, 22, 23, 24, 29, 31 or 35 and the MIMO only with single-stream restriction are indicated in Table 9.1AB, Table 9.1AC, 9.1AD, Table 9.1AE, Table 9.1AF, Table 9.1AG, Table 9.1AH, Table 9.1AI, Table 9.1AJ, Table 9.1AK, Table 9.1AL and Table 9.1AM.

The additional minimum performance requirements for UE supporting one of the HS-DSCH categories 37 or 38 are indicated in Table 9.1AO.

The additional minimum performance requirements for UE supporting one of the HS-DSCH categories 28, 30, 32, 34 or 36 and the MIMO with four transmit antennas only with dual-stream restriction capability are indicated in Table 9.1AF, Table 9.1AG, Table 9.1AI, Table 9.1AJ, Table 9.1AL and Table 9.1AM.

The minimum performance requirements for a particular UE supporting the optional non-contiguous multi-cell operation are determined according to Table 9.1AN.

For the requirements for UEs supporting HS-DSCH categories 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 35, 36, 37 or 38 when the carriers are located in the same frequency band or the carriers belong to the same cell group in Multiflow mode, the spacing of the carrier frequencies of the two cells shall be 5 MHz.

For Multiflow HSDPA requirements in subclause 9.2.5, the serving HS-DSCH cell and the assisting serving HS-DSCH cell shall have the same carrier frequency, and the secondary serving HS-DSCH cell and the assisting secondary serving HS-DSCH cell shall have the same carrier frequency.

For the requirements for UEs supporting HS-DSCH categories 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 or 32 and supporting NC-4C-HSDPA, the spacing of the carrier frequencies belonging to the same subblock of carriers shall be 5MHz. The spacing of the highest carrier frequency of the lowest subblock of carriers and the lowest carrier frequency of the highest subblock of carriers depends on the configuration as indicated in Table 5.0aE and on the UE capability as indicated in the Information Element 'Gap size', [7].

For single link performance with a UE supporting one of the categories 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 35, 36, 37 or 38 and supporting enhanced receiver type 3i, the simplified testing method in Annex C.5.4 can be applied.

For open loop diversity performance with a UE supporting one of the categories 29, 30, 31, 32, 35, 36, 37 or 38, and supporting enhanced receiver type 1, type 3 or type 3i, the simplified testing method in Annex C.5.4 can be applied.

For MIMO performance with a UE supporting one of the categories 30 or 32, and supporting enhanced receiver type 3 or type 3i, the simplified testing method in Annex C.5.4 can be applied.

For Multiflow performance with a UE supporting one of the categories 21, 22, 23, 24, 25, 26, 27 or 28, the simplified testing method in Annex C.5.4A can be applied.

All aforementioned requirements are applicable to the UE when in CELL\_DCH state. Minimum performance requirements for UE being able to receive HS-DSCH and HS-SCCH in CELL\_FACH state are given in Section 9.6.

The propagation conditions for this subclause are defined in table B.1B.

| Category 38                                                                                                                                                            | Table 9.1AI, Table<br>9.1AJ | Table 9.1Al,<br>Table 9.1AJ | N/A                      | H-Set 13C, H-Set 14C                     |  |  |
| Note 1: For UE supporting MIMO mode with four transmit antennas for HS-DSCH the requirements for HS-<br>SCCH Type 4 detection are determined in Tables 9.57B2, 9.57B3. |                             |                             |                          |                                          |  |  |

During the Fixed Reference Channel tests the behaviour of the Node-B emulator in response to the ACK/NACK signalling field of the HS-DPCCH is specified in Table 9.1A:

| Table 9.1A: Node-B | <b>Emulator Behaviou</b> | r in response to | ACK/NACK/DTX |
|--------------------|--------------------------|------------------|--------------|
|                    |                          |                  |              |

| HS-DPCCH ACK/NACK<br>Field State | Node-B Emulator Behaviour                                                                |
|----------------------------------|------------------------------------------------------------------------------------------|
| ACK                              | ACK: new transmission using 1 <sup>st</sup><br>redundancy and constellation version (RV) |
| NACK                             | NACK: retransmission using the next RV (up to the maximum permitted number or RV"s)      |
| DTX                              | DTX: retransmission using the RV<br>previously transmitted to the same H-ARQ<br>process  |

NOTE: Performance requirements in this section assume a sufficient power allocation to HS-SCCH\_1 so that probability of reporting DTX is very low.

## 9.2.1 Single Link performance

The receiver single link performance of the High Speed Physical Downlink Shared Channel (HS-DSCH) in different multi-path fading environments are determined by the information bit throughput R

### 9.2.1.1 Requirement QPSK, Fixed Reference Channel (FRC) H-Set 1/2/3/3A/3B/3C/3E

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels Hset 1/2/3/3A/3A/3B/3E (QPSK version) specified in Annex A.7.1.1, A.7.1.2 and A.7.1.3 respectively, with the addition of the parameters in Table 9.2 and the downlink physical channel setup according to table C.8.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.3. Enhanced performance requirements type 1 specified in Table 9.3A are based on receiver diversity.

# Table 9.2: Test Parameters for Testing QPSK FRCs H-Set 1/H-Set 2/H-Set 3/H-Set 3A/H-Set 3B/H-Set 3C/3E

| Para                                                                                                       | ameter                    | Unit         | Test 1    | Test 2  | Test 3 | Test 4 |

## 9.2.1.2 Requirement 16QAM, Fixed Reference Channel (FRC) H-Set 1/2/3

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels Hset 1/2/3 (16QAM version) specified in Annex A.7.1.1, A.7.1.2 and A.7.1.3 respectively, with the addition of the parameters in Table 9.4 and the downlink physical channel setup according to table C.8.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.5. Enhanced performance requirements type 1 specified in Table 9.5A are based on receiver diversity.

### 9.2.1.3 Minimum requirement QPSK, Fixed Reference Channel (FRC) H-Set 4/5

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels Hset 4/5 specified in Annex A.7.1.4 and A.7.1.5 respectively, with the addition of the parameters in Table 9.6 and the downlink physical channel setup according to table C.8. 193

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.7 for H-Set 4 and table 9.8 for H-Set 5.

### 9.2.1.4 Requirement QPSK, Fixed Reference Channel (FRC) H-Set 6/6A/6B/6C/6E

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channel H-Set 6/6A/6B/6C/6E specified in Annex A.7.1.6 with the addition of the parameters in Table 9.8A and the downlink physical channel setup according to table C.8.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.8B. Enhanced performance requirements type 1 as specified in Table 9.8B1 are based on receiver diversity. Enhanced performance requirements type 2 as specified in Table 9.8B2 are based on chip level equaliser. Enhanced performance requirements type 3 as specified in Table 9.8B3 and in Table 9.8B4 are based on receiver diversity and chip level equaliser. Enhanced performance requirements type 3 is specified in Table 9.8B5 are based on receiver diversity and interference-aware chip level equaliser.

| Parameter                                                                                                                                                                             | Unit         | Test 1    | Test 2 | Test 3 | Test 4 |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|-----------|--------|--------|--------|
| Phase reference                                                                                                                                                                       |              | P-CPICH   |        |        |        |
| I <sub>oc</sub>                                                                                                                                                                       | dBm/3.84 MHz | -60       |        |        |        |

### 9.2.1.5 Requirement 16QAM, Fixed Reference Channel (FRC) H-Set 6/6A/6B/6C/6E

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channel H Set-6/6A/6B/6C/6E specified in Annex A.7.1.6 with the addition of the parameters in Table 9.8C and the downlink physical channel setup according to table C.8.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.8D. Enhanced performance requirements type 1 as specified in Table 9.8D1 are based on receiver diversity. Enhanced performance requirements type 2 as specified in Table 9.8D2 are based on chip level equaliser. Enhanced performance requirements type 3 as specified in Table 9.8D3 and in Table 9.8D4 are based on receiver diversity and chip level equaliser.

| Parameter                                                                                                                                                                                   | Unit         | Test 1 | Test 2 | Test 3    | Test 4 | Test 5 |

## 9.2.1.6 Requirement 64QAM, Fixed Reference Channel (FRC) H-Set 8/8A/8B/8C/8E

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channel H Set-8/8A/8B/8C/8E specified in Annex A.7.1.7 with the addition of the parameters in Table 9.8E and the downlink physical channel setup according to table C.8.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.8F2 and 9.8F3. Enhanced performance requirements type 2 as specified in Table 9.8F2 are based on chip level equaliser. Enhanced performance requirements type 3 as specified in Table 9.8F3 are based on receiver diversity and chip level equaliser.

| Parameter                                                                                                                                                                                    | Unit         | Test 1    |

# 9.2.1.7 Requirement QPSK, Fixed Reference Channel (FRC) H-Set 10/10A/10B/10C/10E

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channel H Set-10/10A/10B/10C/10E specified in Annex A.7.1.10 with the addition of the parameters in Table 9.8G and the downlink physical channel setup according to table C.8.

Using this configuration the throughput shall meet or exceed the minimum performance requirements as specified in table 9.8H and table 9.8H1. Enhanced performance requirements type 2 as specified in Table 9.8H are based on chip level equaliser. Enhanced performance requirements type 3 as specified in Table 9.8H1 are based on receiver diversity and chip level equaliser.

# 9.2.1.8 Requirement 16QAM, Fixed Reference Channel (FRC) H-Set 10/10A/10B/10C/10E

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channel H Set-10/10A/10B/10C/10E specified in Annex A.7.1.10 with the addition of the parameters in Table 9.8I and the downlink physical channel setup according to table C.8.

Using this configuration the throughput shall meet or exceed the minimum performance requirements as specified in table 9.8J and table 9.8J1. Enhanced performance requirements type 2 as specified in Table 9.8J are based on chip level equaliser. Enhanced performance requirements type 3 as specified in Table 9.8J1 are based on receiver diversity and chip level equaliser.

# 9.2.2 Open Loop Diversity performance

The receiver single open loop transmit diversity performance of the High Speed Physical Downlink Shared Channel (HS-DSCH) in multi-path fading environments are determined by the information bit throughput R.

## 9.2.2.1 Requirement QPSK, Fixed Reference Channel (FRC) H-Set 1/2/3/3A/3B/3C/3E

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels H-Set 1/2/3/3A/3B/3C/3E (QPSK version) specified in Annex A.7.1.1, A.7.1.2 and A.7.1.3 respectively, with the addition of the parameters in Table 9.9 and the downlink physical channel setup according to table C.9.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.10. Enhanced performance requirements type 1 specified in Table 9.10A are based on receiver diversity.

Table 9.9: Test Parameters for Testing QPSK FRCs H-Set 1/2/3/3A/3B/3C/3E

# Table 9.10A: Enhanced requirement type 1 QPSK, Fixed Reference Channel (FRC) H-Set 1/2/3/3A/3B/3C/3E

# 9.2.2.2 Requirement 16QAM, Fixed Reference Channel (FRC) H-Set 1/2/3/3A/3B/3C/3E

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels H-Set 1/2/3/3A/3B/3C/3E (16QAM version) specified in Annex A.7.1.1, A.7.1.2 and A.7.1.3 respectively, with the addition of the parameters in Table 9.11 and the downlink physical channel setup according to table C.9.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.12. Enhanced performance requirements type 1 specified in Table 9.12A are based on receiver diversity.

## 9.2.2.3 Minimum requirement QPSK, Fixed Reference Channel (FRC) H-Set 4/5

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels H-Set 4/5 specified in Annex A.7.1.4 and A.7.1.5 respectively, with the addition of the parameters in Table 9.13 and the downlink physical channel setup according to table C.9.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.14 for H-Set 4 and table 9.15 for H-Set 5.

## 9.2.3 Closed Loop Diversity Performance

The closed loop transmit diversity (Mode 1) performance of the High Speed Physical Downlink Shared Channel (HS-DSCH) in multi-path fading environments are determined by the information bit throughput R.

### 9.2.3.1 Requirement QPSK, Fixed Reference Channel (FRC) H-Set 1/2/3

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels H-Set 1/2/3 (QPSK version) specified in Annex A.7.1.1, A.7.1.2 and A.7.1.3 respectively, with the addition of the parameters in Table 9.16 and the downlink physical channel setup according to table C.10.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.17. Enhanced performance requirements type 1 specified in Table 9.17A are based on receiver diversity.

| Parameter                                | Unit                                                                    | Test 1          | Test 2           | Test 3         |
|------------------------------------------|-------------------------------------------------------------------------|-----------------|------------------|----------------|

## 9.2.3.2 Requirement 16QAM, Fixed Reference Channel (FRC) H-Set 1/2/3

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels Hset  $\frac{1}{2}$  (16QAM version) specified in Annex A.7.1.1, A.7.1.2 and A.7.1.3 respectively, with the addition of the parameters in Table 9.18 and the downlink physical channel setup according to table C.10.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.19. Enhanced performance requirements type 1 specified in Table 9.19A are based on receiver diversity.

Table 9.18: Test Parameters for Testing 16-QAM FRCs H-Set 1/H-Set 2/H-Set 3

| Parameter                                                                      | Unit                           | Test 1    | Test 2         | Test 3 |
|--------------------------------------------------------------------------------|--------------------------------|-----------|----------------|--------|

Table 9.19A: Enhanced requirement type 1 16QAM, Fixed Reference Channel (FRC) H-Set 1/2/3

## 9.2.3.3 Minimum requirement QPSK, Fixed Reference Channel (FRC) H-Set 4/5

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels H-set 4/5 specified in Annex A.7.1.4 and A.7.1.5 respectively, with the addition of the parameters in Table 9.20 and the downlink physical channel setup according to table C.10.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.21 for H-Set 4 and table 9.22 for H-Set 5.

 Table 9.22: Minimum requirement QPSK, Fixed Reference Channel (FRC) H-Set 5

## 9.2.3.4 Requirement QPSK, Fixed Reference Channel (FRC) H-Set 6

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channel H-Set 6 specified in Annex A.7.1.6 with the addition of the parameters in Table 9.22A and the downlink physical channel setup according to table C.10.

Using this configuration the throughput shall meet or exceed the requirements specified in table 9.22B. Enhanced performance requirements type 2 as specified in Table 9.22B are based on chip level equaliser.

## 9.2.4 MIMO Performance

The MIMO performance of the High Speed Physical Downlink Shared Channel (HS-DSCH) in multi-path fading environments is determined by the information bit throughput R.

### 9.2.4.1 Requirement Fixed Reference Channel (FRC) H-Set 9/9A/9B/9C/9E

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels H-Set 9/9A/9B/9C/9E specified in Annex A.7.1.9, with the addition of the parameters in Table 9.22E1 and the downlink physical channel setup according to Table C.9 and Table C.12D. Precoding weight set restriction shall not be enabled.

The primary precoding vector signalled on the HS-SCCH and applied on the associated HS-DSCH subframe shall correspond to the preferred primary precoding vector reported immediately before the start of the HS-SCCH subframe.

The determination of applied precoding vector for single transport block transmission shall be as follows: the reported preferred primary precoding vector shall be applied to the primary transport block.

The determination of applied precoding vector for two transport block transmission shall be as follows: If the CQI reported by the UE indicates a preference for a single transport block, the preferred primary precoding vector shall be applied to the primary transport block. If the CQI reported by the UE indicates a preference for two transport blocks, and the preferred primary precoding vector corresponds to the highest reported CQI value, the preferred primary precoding vector shall be applied to the primary transport block. If the CQI reported by the UE indicates a preference for two transport blocks, and the preferred primary precoding vector corresponds to the highest reported by the UE indicates a preference for two transport blocks, and the preferred primary precoding vector does not correspond to the highest reported CQI value, the preferred primary precoding vector shall be applied to the secondary transport block.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in Table 9.22E2 with the downlink physical channel setup in Table C.9, and the minimum requirements specified in Table 9.22E3 with the downlink physical channel setup in Table C.12D.

# Table 9.22E3: Minimum requirement MIMO, Fixed Reference Channel (FRC) H-Set 9/9A/9B/9C/9E with downlink physical channel setup in Table C.12D

## 9.2.4.2 Requirement Fixed Reference Channel (FRC) H-Set 11/11A/11B/11C/11E

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels H-Set 11/11A/11B/11C/11E specified in Annex A.7.1.11, with the addition of the parameters in Table 9.22F1 and the downlink physical channel setup according to Table C.9 and Table C.12D. Precoding weight set restriction shall not be enabled.

The primary precoding vector signalled on the HS-SCCH and applied on the associated HS-DSCH subframe shall correspond to the preferred primary precoding vector reported immediately before the start of the HS-SCCH subframe.

The determination of applied precoding vector for two transport block transmission shall be as follows: If the CQI reported by the UE indicates a preference for a single transport block, the preferred primary precoding vector shall be applied to the primary transport block. If the CQI reported by the UE indicates a preference for two transport blocks, and the preferred primary precoding vector corresponds to the highest reported CQI value, the preferred primary precoding vector shall be applied to the primary precoding vector corresponds to the highest reported by the UE indicates a preference for two transport blocks, and the preferred primary precoding vector shall be applied to the primary precoding vector does not correspond to the highest reported CQI value, the preferred primary precoding vector shall be applied to the secondary transport block.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in Table 9.22F2 with the downlink physical channel setup in Table C.9, and the minimum requirements specified in Table 9.22F3 with the downlink physical channel setup in Table C.12D.

## 9.2.4A MIMO only with single-stream restriction Performance

The MIMO only with single-stream performance of the High Speed Physical Downlink Shared Channel (HS-DSCH) in multi-path fading environments are determined by the information bit throughput R.

## 9.2.4A.1 Requirement QPSK, Fixed Reference Channel (FRC) H-Set 1/1A/1B/1C/1E

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels Hset 1/1A/1B/1C/1E (QPSK version) specified in Annex A.7.1.1, with the addition of the parameters in Table 9.22G1 and the downlink physical channel setup according to Table C.9 and Table C.12D. Precoding weight set restriction shall be enabled for the tests with the downlink physical channel setup according to Table C.12D, defined in Table 9.22G2A and Table 9.22G4. Precoding weight set restriction shall not be enabled for the tests with the downlink physical channel setup according to Table C.9, defined in Table 9.22G2 and Table 9.22G3.

The primary precoding vector signalled on the HS-SCCH and applied on the associated HS-DSCH subframe shall correspond to the preferred primary precoding vector reported immediately before the start of the HS-SCCH subframe.

The determination of applied precoding vector for single transport block transmission shall be as follows: the reported preferred primary precoding vector shall be applied to the primary transport block.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in Table 9.22G2 with the downlink physical channel setup in Table C.9, and the minimum requirements specified in Table 9.22G2A with the downlink physical channel setup in Table C.12D. If UE supports enhanced performance requirements type 3, the throughput shall meet or exceed the minimum requirements specified in Table 9.22G3 with the downlink physical channel setup in Table C.12D. If UE supports enhanced performance requirements type 3, the throughput shall meet or exceed the minimum requirements specified in Table 9.22G3 with the downlink physical channel setup in Table C.9, and the minimum requirements specified in Table 9.22G4 with the downlink physical channel setup in Table C.12D. The performance requirements specified in Table 9.22G2 and Table 9.22G2A are based on chip level equaliser and the performance requirements specified in Table 9.22G3 and Table 9.22G4 are based on chip level equaliser with receiver diversity.

| Parameter                                                                      | Unit         | Test 1 | Test 2 |
|--------------------------------------------------------------------------------|--------------|--------|--------|

# Table 9.22G4: Enhanced requirement type 3 QPSK, Fixed Reference Channel (FRC) H-Set 1/1A/1B/1C/1E with downlink physical channel setup in Table C.12D

### 9.2.4A.2 Requirement 16QAM, Fixed Reference Channel (FRC) H-Set 1/1A/1B/1C/1E

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels Hset 1/1A/1B/1C/1E (16QAM version) specified in Annex A.7.1.1, with the addition of the parameters in Table 9.22H1 and the downlink physical channel setup according to Table C.9 and Table C.12D. Precoding weight set restriction shall be enabled for the tests with the downlink physical channel setup according to Table C.12D, defined in Table 9.22H2A and 9.22H4. Precoding weight set restriction shall not be enabled for the tests with the downlink physical channel setup according to Table C.9, defined in Table 9.22H2 and Table 9.22H3.

The primary precoding vector signalled on the HS-SCCH and applied on the associated HS-DSCH subframe shall correspond to the preferred primary precoding vector reported immediately before the start of the HS-SCCH subframe.

The determination of applied precoding vector for single transport block transmission shall be as follows: the reported preferred primary precoding vector shall be applied to the primary transport block.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in Table 9.22H2 with the downlink physical channel setup in Table C.9, and the minimum requirements specified in Table 9.22H2A with the downlink physical channel setup in Table C.12D. If UE supports enhanced performance requirements type 3, the throughput shall meet or exceed the minimum requirements specified in Table 9.22H3 with the downlink physical channel setup in Table C.12D. If UE supports enhanced performance requirements type 3, the throughput shall meet or exceed the minimum requirements specified in Table 9.22H3 with the downlink physical channel setup in Table C.9, and the minimum requirements specified in Table 9.22H4 with the downlink physical channel setup in Table C.12D. The performance requirements specified in Table 9.22H2 and Table 9.22H2A are based on chip level equaliser and the performance requirements specified in Table 9.22H3 and Table 9.22H4 are based on chip level equaliser with receiver diversity.

Table 9.22H4: Enhanced requirement type 3 16QAM, Fixed Reference Channel (FRC) H-Set1/1A/1B/1C/1E with downlink physical channel setup in Table C.12D

## 9.2.4B Four Transmit Antennas MIMO Performance

The four transmit antennas MIMO performance of the High Speed Physical Downlink Shared Channel (HS-DSCH) in multi-path fading environments is determined by the information bit throughput R.

#### 9.2.4B.1 Requirement Fixed Reference Channel (FRC) H-Set 13A/13C

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels H-Set 13A/13C specified in Annex A.7.1.13, with the addition of the parameters in Table 9.22I1 and the downlink physical channel setup according to Table C.12F.

The precoding weights signalled on the HS-SCCH and applied on the associated HS-DSCH subframe shall correspond to the preferred precoding control index reported immediately before the start of the HS-SCCH subframe.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in Table 9.22I2 with the downlink physical channel setup in Table C.12F.

### 9.2.4B.2 Requirement Fixed Reference Channel (FRC) H-Set 14A/14C

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels H-Set 14A/14C specified in Annex A.7.1.14, with the addition of the parameters in Table 9.22J1 and the downlink physical channel setup according to Table C.12F.

The precoding weights signalled on the HS-SCCH and applied on the associated HS-DSCH subframe shall correspond to the preferred precoding control index vector reported immediately before the start of the HS-SCCH subframe.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in Table 9.22J2 with the downlink physical channel setup in Table C.12F.

## 9.2.4C MIMO Mode with Four Transmit Antennas Only With Dual-stream Restriction Performance

The performance of MIMO mode with four transmit antennas only with dual stream capability for High Speed Physical Downlink Shared Channel (HS-DSCH) in multi-path fading environments are determined by the information bit throughput R.

### 9.2.4C.1 Requirement Fixed Reference Channel (FRC) H-Set 9A/9C

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels Hset 9A/9C specified in Annex A.7.1.9, with the addition of the parameters in Table 9.22K1 and the downlink physical channel setup according to Table C.12F. Precoding weight set restriction shall be enabled for the tests with the downlink physical channel setup according to Table C.12F, defined in Table 9.22K2.

The precoding control index signalled on the HS-SCCH and applied on the associated HS-DSCH subframe shall correspond to the preferred precoding control index reported immediately before the start of the HS-SCCH subframe.

Using this configuration, if UE supports enhanced performance requirements type 3, the throughput shall meet or exceed the minimum requirements specified in Table 9.22K2 with the downlink physical channel setup in Table C.12F. The performance requirements specified in Table 9.22K2 are based on chip level equaliser with receiver diversity.

### 9.2.4C.2 Requirement Fixed Reference Channel (FRC) H-Set 11A/11C

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels Hset 11A/11C specified in Annex A.7.1.11, with the addition of the parameters in Table 9.22K3 and the downlink physical channel setup according to Table C.12F. Precoding weight set restriction shall be enabled for the tests with the downlink physical channel setup according to Table C.12F, defined in Table 9.22K4.

The precoding control index signalled on the HS-SCCH and applied on the associated HS-DSCH subframe shall correspond to the preferred precoding control index reported immediately before the start of the HS-SCCH subframe.

Using this configuration, if UE supports enhanced performance requirements type 3, the throughput shall meet or exceed the minimum requirements specified in Table 9.22K4 with the downlink physical channel setup in Table C.12F. The performance requirements specified in Table 9.22K4 are based on chip level equaliser with receiver diversity.

### 9.2.5 Multiflow HSDPA performance

The Multiflow HSDPA performance in multi-path fading environments is determined by the information bit throughput R.

### 9.2.5.1 Requirement Fixed Reference Channel (FRC) H-Set 6 16QAM/QPSK

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels H-Set 6 16QAM (HS-DSCH serving cell) and QPSK (assisting HS-DSCH serving cell) specified in Annex A.7.1.6, with the addition of the parameters in Table 9.22H5 and the test set-up in Annex C.5.5.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.22H6.

#### Table 9.22H5: Test Parameters for Testing FRC H-Set 6 16QAM and QPSK

| Parameter                                                                                                                                                                                   | Unit         | Test 1  | Test 2                                 | Test 3 | Test 4 |

Table 9.22H6: Minimum requirement QPSK, FRC H-Set 6 16QAM and QPSK

# 9.3 Reporting of Channel Quality Indicator

The propagation conditions for this subclause are defined in table B.1C for non-MIMO operation under fading conditions, in subclause B.2.6.1 for MIMO operation under single stream conditions, and in subclause B.2.6.2 for MIMO operation under dual stream conditions.

For the cases in this subclause where CQI reporting is evaluated under fading conditions or under MIMO single/dual stream conditions it is expected that the UE will not always detect the HS-SCCH, resulting in a DTX for the uplink ACK/NACK transmission. The downlink configuration for evaluating CQI performance does not use retransmission. Therefore any BLER calculations must exclude any packets where the UE may have attempted to combine data from more than one transmission due to having missed one or more new data indicators or initial transmissions in MIMO operation from lost HS-SCCH transmissions.

For the requirements for UEs supporting HS-DSCH categories 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 35 and 36, when the carriers are located in the same frequency band or the carriers belong to the same cell group in Multiflow mode, the spacing of the carrier frequencies of the two cells shall be 5 MHz.

For Multiflow HSDPA requirements in subclause 9.2.5, the serving HS-DSCH cell and the assisting serving HS-DSCH cell shall have the same carrier frequency, and the secondary serving HS-DSCH cell and the assisting secondary serving HS-DSCH cell shall have the same carrier frequency.

## 9.3.1 Single Link Performance

#### 9.3.1.1 AWGN propagation conditions

The reporting accuracy of channel quality indicator (CQI) under AWGN environments is determined by the reporting variance and the BLER performance using the transport format indicated by the reported CQI median.

#### 9.3.1.1.1 Minimum Requirement – UE HS-DSCH categories 1-20

For the parameters specified in Table 9.23, and using the downlink physical channels specified in table C.8, the reported CQI value shall be in the range of +/-2 of the reported median more than 90% of the time. If the HS-PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1, the BLER using the transport format indicated by the (median CQI +2) shall be greater than 0.1. If the HS-PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI -1) shall be less than or equal to 0.1.

Table 9.23: Test Parameter for CQI test in AWGN – single link

#### 9.3.1.1.2 Minimum Requirement – UE HS-DSCH categories 13,14,17,18, 19 and 20

For the parameters specified in Table 9.24, and using the downlink physical channels specified in table C.8, the reported CQI value shall be in the range of +/-2 of the reported median more than 90% of the time. If the HS-PDSCH BLER using the transport format indicated by median CQI is less than or equal to 0.1, the BLER using the transport format indicated by the (median CQI + 2) shall be greater than 0.1. If the HS-PDSCH BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI -1) shall be less than or equal to 0.1.

#### Table 9.24: Test Parameter for CQI test in AWGN – single link

# 9.3.1.1.3 Additional Requirements – UE HS-DSCH categories 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 35 and 36

For the parameters specified in Table 9.25, and using the downlink physical channels specified in table C.8, with a serving HS-DSCH cell and secondary serving HS-DSCH cell(s) configured, for each of the serving cells, the reported CQI value for the cell shall be in the range of +/-2 of the cell-specific reported median more than 90% of the time. If the HS-PDSCH BLER, for any of the cells, using the transport format indicated by cell-specific median CQI is less than or equal to 0.1, the BLER for this cell using the transport format indicated by the (cell-specific median CQI +2) shall be greater than 0.1. If the HS-PDSCH BLER, for any of the cells, using the transport format indicated by (cell-specific median CQI -1) shall be less than or equal to 0.1.

Table 9.25: Test Parameter for CQI test in AWGN – single link

#### 9.3.1.2 Fading propagation conditions

The reporting accuracy of the channel quality indicator (CQI) under fading environments is determined by the BLER performance using the transport format indicated by the reported CQI median.

The specified requirements may be subject to further simulations to verify assumptions.

#### 9.3.1.2.1 Minimum Requirement – UE HS-DSCH categories 1-20

For the parameters specified in Table 9.26, and using the downlink physical channels specified in table C.8, the requirements are specified in terms of maximum BLERs at particular reported CQIs when transmitting a fixed transport format given by the CQI median as shown in Table 9.27. The BLER at a particular reported CQI is obtained by associating a particular CQI reference measurement period with the HS-PDSCH subframe overlapping with the end of this CQI reference measurement period and calculating the fraction of erroneous HS-PDSCH subframes.

#### Table 9.27: Minimum requirement for CQI test in fading – single link

| Bonortod COI   | Maximum BLER |       |  |
|----------------|--------------|-------|--|
| Reported CQI   | Test 1       | Test2 |  |
| CQI median     | 60%          | 60%   |  |
| CQI median + 3 | 15%          | 15%   |  |

#### 9.3.1.2.2 Minimum Requirement – UE HS-DSCH categories 13,14,17,18, 19 and 20

For the parameters specified in Table 9.27A, and using the downlink physical channels specified in table C.8, the requirements are specified in terms of maximum BLERs at particular reported CQIs when transmitting a fixed transport format given by the CQI median as shown in Table 9.27B. The BLER at a particular reported CQI is obtained by associating a particular CQI reference measurement period with the HS-PDSCH subframe overlapping with the end of this CQI reference measurement period and calculating the fraction of erroneous HS-PDSCH subframes.

| Parameter                                                                                                                                                                                                                                                                                                        | Unit                                                                                                     | Test 1                                                                                                                                                                                                                                                                              |  |

| Note 4: For any given transport format the power of the HS-SCCH and HS-<br>PDSCH shall be transmitted continuously with constant power.                                                                                                                                                                          |                                                                                                          |                                                                                                                                                                                                                                                                                     |  |
|                                                                                                                                                                                                                                                                                                                  | The UE shall be configured in 64QAM/non-MIMO mode and use appropriate CQI tables according to TS 25.214. |                                                                                                                                                                                                                                                                                     |  |

#### Table 9.27B: Minimum requirement for CQI test in fading - single link

| Reported CQI   | Maximum BLER |  |
|----------------|--------------|--|
|                | Test 1       |  |
| CQI median     | 60%          |  |
| CQI median + 3 | 15%          |  |

# 9.3.1.2.3 Additional Requirements – UE HS-DSCH categories 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 35 and 36

For the parameters specified in Table 9.26, and using the downlink physical channels specified in table C.8, with a serving HS-DSCH cell and secondary serving HS-DSCH cell(s) configured, for each of the serving cells, the requirements are specified in terms of maximum BLERs at particular reported CQIs for each serving cell when transmitting with a cell-specific fixed transport format given by the cell-specific CQI median as shown in Table 9.27. The BLER at a particular reported CQI for a specific serving cell is obtained by associating a particular CQI reference measurement period with the HS-PDSCH subframe transmitted from this serving cell overlapping with the end of this CQI reference measurement period and calculating the fraction of erroneous HS-PDSCH subframes.

#### 9.3.1.3 Periodically varying radio conditions.

The reporting accuracy of the channel quality indicator (CQI) when subject to AWGN propagation conditions with periodically varying  $\hat{I}_{or}/I_{oc}$ , is determined by the reporting variance as measured during selected parts of a predetermined  $\hat{I}_{or}/I_{oc}$  pattern, as depicted in Figure 9.1.

# Figure 9.1 Test scenario for CQI reporting test under varying interference conditions. $I_{or}/I_{oc}$ is varied between $\alpha$ 1 and $\alpha$ 2 according to a predetermined square wave pattern.

#### 9.3.1.3.1 Minimum Requirement – UE HS-DSCH categories 1-20

For the parameters specified in Table 9.27C, and using the downlink physical channels specified in table C.8, let  $M_1$  be defined as the median CQI that the UE reports in static propagation conditions, with Ior/Ioc set to  $\alpha_1$ , and  $M_2$  be the median CQI that the UE reports in static propagation conditions, with  $\hat{I}_{or}/I_{oc}$  set to  $\alpha_2$ . The minimum difference between  $M_1$  and  $M_2$  is required to be larger than 6.

For the parameters specified in Table 9.27C, and using the downlink physical channels specified in table C.8, 90% of the reported CQI values, during  $T_{\text{measure}}$  as depicted in Figure 9.1, shall be in the range of +/-3 of M1, for the cases when  $T_{\text{measure}}$  occurs during time-periods where  $\hat{I}_{or}/I_{oc}$  is set to  $\alpha_1$ , and in the range of +/-3 of M2, for the cases when  $T_{\text{measure}}$  occurs during time-periods where  $\hat{I}_{or}/I_{oc}$  is set to  $\alpha_2$ .

The measurement equipment is allowed to start the ramping of  $\hat{I}_{or}/I_{oc}$  13 slots before the start of the HS-DPCCH slot that contains the first CQI report in T<sub>measure</sub>.

The measurement equipment shall have settled  $\hat{I}_{or}/I_{oc}$  to its nominal value 10 slots before the start of the HS-DPCCH slot that contains the first CQI report in T<sub>measure</sub>.

An illustration of these timing relations is provided in Figure 9.2.

| Parameter                                                                                                                                                                                                                                      | Unit         | Test 1                                                                                                                                                                                                                                                                            |

| <ul> <li>Note 1: Measurement power offset 'Γ' is configured by RRC accordingly and as defined in [7].</li> <li>Note 2: The UE shall be configured in non-64QAM/non-MIMO mode and use appropriate CQI tables according to TS 25.214.</li> </ul> |              |                                                                                                                                                                                                                                                                                   |

#### Table 9.27C: Test Parameter for CQI test in periodically varying radio conditions - single link

Figure 9.2 Timing relation between HS-DPCCH, DPCCH/DPDCH and  $\hat{I}_{or}/I_{oc}$  ramping. The measurement equipment starts ramping the  $\hat{I}_{or}/I_{oc}$  at point 1. The  $\hat{I}_{or}/I_{oc}$  should be settled to its nominal value at point 2. The first CQI report that is counted in the statistics of the requirement is transmitted in the uplink at point 3.

# 9.3.2 Open Loop Diversity Performance

#### 9.3.2.1 AWGN propagation conditions

The reporting accuracy of channel quality indicator (CQI) under AWGN environments is determined by the reporting variance and the BLER performance using the transport format indicated by the reported CQI median.

#### 9.3.2.1.1 Minimum Requirement – UE HS-DSCH categories 1-20

For the parameters specified in Table 9.32, and using the downlink physical channels specified in table C.9, the reported CQI value shall be in the range of +/-2 of the reported median more than 90% of the time. If the HS-PDSCH (BLER) using the transport format indicated by median CQI is less than or equal to 0.1, the BLER using the transport format indicated by the (median CQI +2) shall be greater than 0.1. If the HS-PDSCH (BLER) using the transport format indicated by the median CQI is greater than 0.1, the BLER using transport format indicated by (median CQI -1) shall be less than or equal to 0.1.

#### Table 9.32: Test Parameter for CQI test in AWGN – open loop diversity

9.3.2.1.2 Additional Requirements – UE HS-DSCH categories 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 35 and 36

For the parameters specified in Table 9.33, and using the downlink physical channels specified in table C.9, with a serving HS-DSCH cell and secondary serving HS-DSCH cell(s) configured, for each of the serving cells, the reported CQI value for the cell shall be in the range of +/-2 of the cell-specific reported median more than 90% of the time. If the

HS-PDSCH BLER, for any of the cells, using the transport format indicated by cell-specific median CQI is less than or equal to 0.1, the BLER for this cell using the transport format indicated by the (cell-specific median CQI +2) shall be greater than 0.1. If the HS-PDSCH BLER, for any of the cells, using the transport format indicated by the cell-specific median CQI is greater than 0.1, the BLER using transport format indicated by (cell-specific median CQI -1) shall be less than or equal to 0.1.

Table 9.33: Test Parameter for CQI test in AWGN – open loop diversity

#### 9.3.2.2 Fading propagation conditions

The reporting accuracy of the channel quality indicator (CQI) under fading environments is determined by the BLER performance using the transport format indicated by the reported CQI median.

The specified requirements may be subject to further simulations to verify assumptions.

#### 9.3.2.2.1 Minimum Requirement – UE HS-DSCH categories 1-20

For the parameters specified in Table 9.35, and using the downlink physical channels specified in table C.9, the requirements are specified in terms of maximum BLERs at particular reported CQIs when transmitting a fixed transport format given by the CQI median as shown in Table 9.36. The BLER at a particular reported CQI is obtained by associating a particular CQI reference measurement period with the HS-PDSCH subframe overlapping with the end of this CQI reference measurement period and calculating the fraction of erroneous HS-PDSCH subframes.

# 9.3.2.2.2 Additional Requirements – UE HS-DSCH categories 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 35 and 36

For the parameters specified in Table 9.35 and using the downlink physical channels specified in table C.9, with a serving HS-DSCH cell and secondary serving HS-DSCH cell(s) configured, for each of the serving cells, the requirements are specified in terms of maximum BLERs at particular reported CQIs for each serving cell when transmitting with a cell-specific fixed transport format given by the cell-specific CQI median as shown in Table 9.36. The BLER at a particular reported CQI for a specific serving cell is obtained by associating a particular CQI reference measurement period with the HS-PDSCH subframe transmitted from this serving cell overlapping with the end of this CQI reference measurement period and calculating the fraction of erroneous HS-PDSCH subframes.

#### 9.3.2.3 Periodically varying radio conditions.

The reporting accuracy of the channel quality indicator (CQI) when subject to AWGN propagation conditions with periodically varying  $\hat{I}_{or}/I_{oc}$ , is determined by the reporting variance as measured during selected parts of a predetermined  $\hat{I}_{or}/I_{oc}$  pattern, as depicted in Figure 9.1.

#### 9.3.2.3.1 Minimum Requirement – UE HS-DSCH categories 1-20

For the parameters specified in Table 9.37, and using the downlink physical channels specified in table C.9, let  $M_1$  be defined as the median CQI that the UE reports in static propagation conditions, with Ior/Ioc set to  $\alpha_1$ , and  $M_2$  be the median CQI that the UE reports in static propagation conditions, with  $\hat{I}_{or}/I_{oc}$  set to  $\alpha_2$ . The minimum difference between  $M_1$  and  $M_2$  is required to be larger than 6.

For the parameters specified in Table 9.37, and using the downlink physical channels specified in table C.9, 90% of the reported CQI values, during  $T_{measure}$  as depicted in Figure 9.1, shall be in the range of +/-3 of M1, for the cases when  $T_{measure}$  occurs during time-periods where  $\hat{I}_{or}/I_{oc}$  is set to  $\alpha_1$  and in the range of +/-3 of M2, for the cases when  $T_{measure}$  occurs during time-periods where  $\hat{I}_{or}/I_{oc}$  is set to  $\alpha_2$ .

The measurement equipment is allowed to start the ramping of  $\hat{I}_{or}/I_{oc}$  13 slots before the start of the HS-DPCCH slot that contains the first CQI report in T<sub>measure</sub>.

The measurement equipment shall have settled  $\hat{I}_{or}/I_{oc}$  to its nominal value 10 slots before the start of the HS-DPCCH slot that contains the first CQI report in T<sub>measure</sub>.

An illustration of these timing relations is provided in Figure 9.2.

| Parameter                                                                                                                                                                                                                                      | Unit         | Test 1                                                                                                                                                                                                                                                                            |  |

#### Table 9.37: Test Parameter for CQI test in periodically varying radio conditions - open loop diversity

### 9.3.3 Closed Loop Diversity Performance

#### 9.3.3.1 AWGN propagation conditions

The reporting accuracy of channel quality indicator (CQI) under AWGN environments is determined by the reporting variance and the BLER performance using the transport format indicated by the reported CQI median.

#### 9.3.3.1.1 Minimum Requirement – UE HS-DSCH categories 1-20

For the parameters specified in Table 9.41, and using the downlink physical channels specified in table C.10, the reported CQI value shall be in the range of +/-2 of the reported median more than 90% of the time. If the HS-PDSCH (BLER) using the transport format indicated by median CQI is less than or equal to 0.1, the BLER using the transport format indicated by the (median CQI +2) shall be greater than 0.1. If the HS-PDSCH (BLER) using transport format indicated by the median CQI is greater than 0.1, the BLER using the transport format indicated by the median CQI is greater than 0.1, the BLER using the transport format indicated by (median CQI -1) shall be less than or equal to 0.1.

| Parameter                                      | Unit                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Test 1                                                                                                                                                                                                                                                                            | Test 2  | Test 3        |

Table 9.41: Test Parameters for CQI in AWGN – closed loop diversity

### 9.3.3.2 Fading propagation conditions

The reporting accuracy of the channel quality indicator (CQI) under fading environments is determined by the BLER performance using the transport format indicated by the reported CQI median.

The specified requirements may be subject to further simulations to verify assumptions.

#### 9.3.3.2.1 Minimum Requirement – UE HS-DSCH categories 1-20

For the parameters specified in Table 9.44, and using the downlink physical channels specified in table C.10, the requirements are specified in terms of maximum BLERs at particular reported CQIs when transmitting a fixed transport format given by the CQI median as shown in Table 9.45. The BLER at a particular reported CQI is obtained by associating a particular CQI reference measurement period with the HS-PDSCH subframe overlapping with the end of this CQI reference measurement period and calculating the fraction of erroneous HS-PDSCH subframes.

#### Table 9.44: Test Parameters for CQI test in fading- closed loop diversity

Table 9.45: Minimum requirement for CQI test in fading – closed loop diversity

| Reported CQI   | Maximum BLER |       |  |
|----------------|--------------|-------|--|
|                | Test 1       | Test2 |  |
| CQI median     | 60%          | 60%   |  |
| CQI median + 3 | 15%          | 15%   |  |

#### 9.3.3.3 Periodically varying radio conditions.

The reporting accuracy of the channel quality indicator (CQI) when subject to AWGN propagation conditions with periodically varying  $\hat{I}_{or}/I_{oc}$ , is determined by the reporting variance as measured during selected parts of a predetermined  $\hat{I}_{or}/I_{oc}$  pattern, as depicted in Figure 9.1.

#### 9.3.3.3.1 Minimum Requirement – UE HS-DSCH categories 1-20

For the parameters specified in Table 9.45A, and using the downlink physical channels specified in table C.10, let  $M_1$  be defined as the median CQI that the UE reports in static propagation conditions, with Ior/Ioc set to  $\alpha_1$ , and  $M_2$  be the median CQI that the UE reports in static propagation conditions, with  $\hat{I}_{or} / I_{oc}$  set to  $\alpha_2$ . The minimum difference between  $M_1$  and  $M_2$  is required to be larger than 6.

For the parameters specified in Table 9.45A, and using the downlink physical channels specified in table C.10, 90% of the reported CQI values, during  $T_{\text{measure}}$  as depicted in Figure 9.1, shall be in the range of +/-3 of M1, for the cases when  $T_{\text{measure}}$  occurs during time-periods where  $\hat{I}_{or}/I_{oc}$  is set to  $\alpha_1$ , and in the range of +/-3 of M2, for the cases when  $T_{\text{measure}}$  occurs during time-periods where  $\hat{I}_{or}/I_{oc}$  is set to  $\alpha_2$ .

The measurement equipment is allowed to start the ramping of  $\hat{I}_{or}/I_{oc}$  13 slots before the start of the HS-DPCCH slot that contains the first CQI report in T<sub>measure</sub>.

The measurement equipment shall have settled  $\hat{I}_{or}/I_{oc}$  to its nominal value 10 slots before the start of the HS-DPCCH slot that contains the first CQI report in T<sub>measure</sub>.

An illustration of these timing relations is provided in Figure 9.2.

| Parameter                                                                                                                                                                                                                                              | Unit         | Test 1                                                                                                                                                                                                                                                                            |  |

# Table 9.45A: Test Parameter for CQI test in periodically varying radio conditions – closed loop diversity

## 9.3.4 MIMO Performance

### 9.3.4.1 MIMO Single Stream Fading Conditions

The minimum performance requirements of channel quality indicator (CQI) reporting under MIMO single stream conditions are defined based on a CQI Type A versus Type B reporting ratio of 1 / 2, i.e. the parameters  $N_cqi_typeA$  and  $M_cqi$  (see [8]) are assumed to be set to 1 and 2, respectively. The propagation conditions assumed for minimum performance requirements of CQI reporting under MIMO single stream conditions are defined in subclause B.2.6.1. The precoding used at the transmitter is one randomly picked but fixed precoding vector for single transport block transmission out of the set of possible precoding vectors as defined in [8]. The same precoding vector shall be used to generate the resulting channel coefficients as described for MIMO single stream conditions in subclause B.2.6.1.

The reporting accuracy of CQI under MIMO single stream conditions is determined by the BLER performance when transmitting with a transport format indicated by the reported CQI median determined over all single transport block Type A CQI reports and all Type B CQI reports that were reported together with PCI reports matching the precoding vector embedded in the propagation channel as defined in subclause B.2.6.1.

#### 9.3.4.1.1 Minimum Requirement - UE HS-DSCH categories 15-20

For the parameters specified in Table 9.46, and using the downlink physical channels specified in Table C.9 and Table C.12D, the requirements are specified in terms of maximum BLERs at particular reported CQIs when transmitting a fixed transport format given by the CQI median as shown in Table 9.47. The CQI median shall be determined over all single transport block Type A CQI reports and all Type B CQI reports that were reported together with PCI reports matching the precoding vector embedded in the propagation channel as defined in subclause B.2.6.1. The BLER at a particular reported CQI is obtained by associating a particular CQI reference measurement period for all single transport block Type A CQI reports and all Type B CQI reports that were reported together with PCI reports block Type A CQI reports and all Type B CQI reports that were reported together with PCI reports block Type A CQI reports and all Type B CQI reports that were reported together with PCI reports block Type A CQI reports and all Type B CQI reports that were reported together with PCI reports matching the precoding vector embedded in the propagation channel as defined in subclause B.2.6.1 with the HS-PDSCH subframe overlapping with the end of this CQI reference measurement period and calculating the fraction of erroneous HS-PDSCH subframes to which the same CQI value was associated.

#### Table 9.46: Test Parameters for CQI test in MIMO single stream fading conditions

Table 9.47: Minimum requirement for CQI test in MIMO single stream conditions

| Reported CQI   | Maximum BLER |        |  |
|----------------|--------------|--------|--|
| Reported CQI   | Test 1       | Test 2 |  |
| CQI median     | 60%          | 60%    |  |
| CQI median + 3 | 15%          | 15%    |  |

#### 9.3.4.1.2 Additional Requirement – UE HS-DSCH categories 25-28, 30, 32 and 36

With a serving HS-DSCH cell and secondary serving HS-DSCH cell(s) configured, using the parameters specified in Table 9.47A, and using the downlink physical channels specified in Table C.9 and Table C.12D, the requirements are specified in terms of maximum BLERs at particular reported CQIs when transmitting a fixed transport format given by the cell-specific CQI median as shown in Table 9.47B. The requirement is applicable for each cell individually, that is the median reported CQI, as well as corresponding BLERs, are to be separately determined for each cell and independently verified against the requirement in Table 9.47B. The cell-specific CQI median shall be determined over all single transport block Type A CQI reports and all Type B CQI reports that were reported together with PCI reports BLER at a particular reported CQI is obtained by associating a particular CQI reference measurement period for all single transport block Type A CQI reports and all Type B CQI reports that were reported together with PCI reports BLER at a particular reported CQI is obtained by associating a particular CQI reference measurement period for all single transport block Type A CQI reports and all Type B CQI reports that were reported together with PCI reports matching the cell-specific precoding vector embedded in the propagation channel as defined in subclause B.2.6.1. The cell-specific BLER at a particular reported CQI is obtained by associating a particular CQI reference measurement period for all single transport block Type A CQI reports and all Type B CQI reports that were reported together with PCI reports matching the cell-specific precoding vector embedded in the propagation channel as defined in subclause B.2.6.1. with

the HS-PDSCH subframe overlapping with the end of this CQI reference measurement period and calculating the fraction of erroneous HS-PDSCH subframes to which the same CQI value was associated.

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Unit         | Test 1                                                                                                                                                                                                                                                                     | Test 2                        |

Table 9.47B: Minimum requirement for CQI test in MIMO single stream conditions

| Benerted COI   | Maximum BLER |        |
|----------------|--------------|--------|
| Reported CQI   | Test 1       | Test 2 |
| CQI median     | 60%          | 60%    |
| CQI median + 3 | 15%          | 15%    |

#### 9.3.4.2 MIMO Dual Stream Fading Conditions

The minimum performance requirements of channel quality indicator (CQI) reporting under MIMO dual stream conditions are defined based on a Type A reporting fraction of 100%, i.e. the parameters  $N_{cqi_typeA}$  and  $M_{cqi}$  (see [8]) are assumed to be both set to 1. The propagation conditions assumed for minimum performance requirements of CQI reporting under MIMO dual stream conditions are defined in subclause B.2.6.2. The precoding used at the transmitter is one randomly picked but fixed precoding matrix for dual transport block transmission out of the set of

possible precoding matrices as defined in [8]. The same precoding matrix shall be used to generate the resulting channel coefficients as described for MIMO dual stream conditions in subclause B.2.6.2.

The reporting accuracy of CQI under MIMO dual stream conditions is determined by the BLER performance of two streams of transport blocks using the transport formats indicated by the respective stream specific reported CQI median over all dual transport block CQI reports for each stream that were reported together with PCI reports matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2.

#### 9.3.4.2.1 Minimum Requirement – UE HS-DSCH categories 15-20

For the parameters specified in Table 9.48, and using the downlink physical channels specified in Table C.9 and Table C.12D, the requirements are specified in terms of maximum BLERs at particular reported CQIs for each stream when transmitting a fixed transport format per stream given by the stream specific CQI median as shown in Table 9.49. The stream specific CQI median shall be determined over all dual transport block CQI reports that were reported together with PCI reports matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2. When the reported preferred primary precoding vector is matching with the first column of the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2, the reported values  $CQI_1$  and  $CQI_2$  shall be used respectively to determine the median CQI values for stream #1 and stream #2 as depicted in Figure B.5 in subclause B.2.6.2. When the reported preferred primary precoding vector is matching with the second column of the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2, the reported values  $COI_1$  and  $COI_2$  shall be used to determine the median CQI values for stream #2 and stream #1, respectively. The stream specific BLER at a particular reported CQI is obtained by associating a particular CQI reference measurement period for all dual transport block CQI reports that were reported together with a PCI report that was matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2 with the two transport blocks of the HS-PDSCH subframe overlapping with the end of this CQI reference measurement period and calculating the fractions of erroneous HS-PDSCH subframes to which the same CQI values were associated.

| <ul> <li>Note 1: Measurement power offset 'Γ' is configured by RRC accordingly and as defined in [7].</li> <li>Note 2: TF for HS-PDSCH is configured for each stream according to the reported CQI statistics. TF for each stream is based on median CQI over all dual transport block CQI reports that are reported together with a PCI report that is matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2. Other physical channel parameters are configured according to the CQI mapping table described in TS25.214. The precoding that shall be used in the transmitter is one randomly picked but fixed precoding matrix for dual transport block transmission out of the set of possible precoding matrices as defined in [8]. The same precoding matrix shall be used to generate the resulting channel coefficients as described for MIMO dual stream conditions in subclause B.2.6.2.</li> </ul> |                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                            |                               |
| Note 4: For any giver<br>continuously                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <ul> <li>e 4: For any given transport format the power of the HS-SCCH and HS-PDSCH shall be transmitted continuously with constant power.</li> <li>e 5: The UE shall be configured in non-64QAM/MIMO mode and use appropriate CQI tables according to</li> </ul> |                                                                                                                                                                                                                                                                            |                               |

#### Table 9.48: Test Parameters for CQI test in MIMO dual stream fading conditions

Table 9.49: Minimum requirement for CQI test in MIMO dual stream conditions

| Benerted COI   | Maximum BLER |        |
|----------------|--------------|--------|
| Reported CQI   | Test 1       | Test 2 |
| CQI median     | 60%          | 60%    |
| CQI median + 2 | 15%          | 15%    |

#### 9.3.4.2.2 Minimum Requirement – UE HS-DSCH categories 19-20

For the parameters specified in Table 9.49A, and using the downlink physical channels specified in table C.9 and Table C.12D, the requirements are specified in terms of maximum BLERs at particular reported CQIs for each stream when transmitting a fixed transport format per stream given by the stream specific CQI median as shown in Table 9.49B. The stream specific CQI median shall be determined over all dual transport block CQI reports that were reported together with PCI reports matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2. When the reported preferred primary precoding vector is matching with the first column of the precoding matrix embedded in the propagation channel as defined in Subclause B.2.6.2. When the reported values CQI<sub>1</sub> and CQI<sub>2</sub> shall be used respectively to determine the median CQI values for stream #1 and stream #2 as depicted in Figure B.5 in subclause B.2.6.2. When the reported preferred primary precoding vector is matching with the second column of the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2, the reported values CQI<sub>1</sub> and CQI<sub>2</sub> shall be used respectively to determine the median CQI values for stream #1 and stream #2 as depicted in Figure B.5 in subclause B.2.6.2. When the reported preferred primary precoding vector is matching with the second column of the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2, the reported values CQI<sub>1</sub> and CQI<sub>2</sub> shall be used to determine the median CQI values for stream #2 and stream #1, respectively. The stream specific BLER at a

particular reported CQI is obtained by associating a particular CQI reference measurement period for all dual transport block CQI reports that were reported together with a PCI report that was matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2 with the two transport blocks of the HS-PDSCH subframe overlapping with the end of this CQI reference measurement period and calculating the fractions of erroneous HS-PDSCH subframes to which the same CQI values were associated.

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Unit                                                                            | Test 1                                                                                                                                                                                                                                                                     | Test 2                        |

| <ul> <li>Note 1: Measurement power offset 'Γ' is configured by RRC accordingly and as defined in [7].</li> <li>Note 2: TF for HS-PDSCH is configured for each stream according to the reported CQI statistics. TF for each stream is based on median CQI over all dual transport block CQI reports that are reported together with a PCI report that is matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2. Other physical channel parameters are configured according to the CQI mapping table described in TS25.214. The precoding that shall be used in the transmitter is one randomly picked but fixed precoding matrix for dual transport block transmission out of the set of possible precoding matrices as defined in [8]. The same precoding matrix shall be used to generate the resulting channel coefficients as described for MIMO dual stream conditions in subclause B.2.6.2.</li> </ul> |                                                                                 |                                                                                                                                                                                                                                                                            |                               |

Table 9.49A: Test Parameters for CQI test in MIMO dual stream conditions

| Bonortod COI   | Maximum BLER |        |
|----------------|--------------|--------|
| Reported CQI   | Test 1       | Test 2 |
| CQI median     | 60%          | 60%    |
| CQI median + 2 | 15%          | 15%    |

#### 9.3.4.2.3 Additional Requirement – UE HS-DSCH categories 25-28, 30, 32 and 36

With a serving HS-DSCH cell and secondary serving HS-DSCH cell(s) configured, using the parameters specified in Table 9.49BA, and using the downlink physical channels specified in Table C.9 and Table C.12D, the requirements are specified in terms of maximum BLERs at particular reported CQIs for each stream when transmitting a fixed transport format per stream given by the stream specific CQI median as shown in Table 9.49BB. The requirement is applicable for each cell and stream individually, that is the median reported CQI, as well as corresponding BLERs, are to be

separately determined for each cell and stream, and independently verified against the requirement in Table 9.49BB. The stream and cell-specific CQI median shall be determined over all dual transport block CQI reports that were reported together with PCI reports matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2. When the reported preferred primary precoding vector is matching with the first column of the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2, the reported values CQI<sub>1</sub> and CQI<sub>2</sub> shall be used respectively to determine the median CQI values for stream #1 and stream #2 as depicted in Figure B.5 in subclause B.2.6.2. When the reported preferred primary precoding vector is matching with the second column of the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2, the reported values CQI<sub>1</sub> and CQI<sub>2</sub> shall be used to determine the median CQI values for stream #1 and stream #2 as depicted in Figure B.5 in subclause B.2.6.2. When the reported preferred primary precoding vector is matching with the second column of the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2, the reported values CQI<sub>1</sub> and CQI<sub>2</sub> shall be used to determine the median CQI values for stream #2 and stream #1, respectively.The stream and cell-specific BLER at a particular reported CQI is obtained by associating a particular CQI reference measurement period for all dual transport block CQI reports that were reported together with a PCI report that was matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2 with the two transport blocks of the HS-PDSCH subframe overlapping with the end of this CQI reference measurement period and calculating the fractions of erroneous HS-PDSCH subframes to which the same CQI values were associated.

| <ul> <li>Note 1: Measurement power offset 'T' is configured by RRC accordingly and as defined in [7].</li> <li>Note 2: TF for HS-PDSCH is configured for each stream according to the reported CQI statistics. TF for each stream is based on median CQI over all dual transport block CQI reports that are reported together with a PCI report that is matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2. Other physical channel parameters are configured according to the CQI mapping table described in TS25.214. The precoding that shall be used in the transmitter is one randomly picked but fixed precoding matrix for dual transport block transmission out of the set of possible precoding matrices as defined in [8]. The same precoding matrix shall be used to generate the resulting channel coefficients as described for MIMO dual stream conditions in subclause B.2.6.2.</li> </ul> |                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                            |                               |
| Note 4: For any given tra<br>continuously with                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <ul> <li>For any given transport format the power of the HS-SCCH and HS-PDSCH shall be transmitted continuously with constant power.</li> <li>The UE shall be configured in non-64QAM/MIMO mode and use appropriate CQI tables according to</li> </ul> |                                                                                                                                                                                                                                                                            |                               |

Table 9.49BB: Minimum requirement for CQI test in MIMO dual stream conditions

#### 9.3.4.2.4 Additional Requirement – UE HS-DSCH categories 27, 28, 30, 32 and 36

With a serving HS-DSCH cell and secondary serving HS-DSCH cell(s) configured, using the parameters specified in Table 9.49BC, and using the downlink physical channels specified in Table C.9 and Table C.12D, the requirements are specified in terms of maximum BLERs at particular reported CQIs for each stream when transmitting a fixed transport format per stream given by the stream specific CQI median as shown in Table 9.49BD. The requirement is applicable for each cell and stream individually, that is the median reported CQI, as well as corresponding BLERs, are to be separately determined for each cell and stream, and independently verified against the requirement in Table 9.49BB. The stream and cell-specific CQI median shall be determined over all dual transport block CQI reports that were reported together with PCI reports matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2. When the reported preferred primary precoding vector is matching with the first column of the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2, the reported values CQI<sub>1</sub> and CQI<sub>2</sub> shall be used respectively to determine the median CQI values for stream #1 and stream #2 as depicted in Figure B.5 in subclause B.2.6.2. When the reported preferred primary precoding vector is matching with the second column of the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2, the reported values  $CQI_1$ and  $CQI_2$  shall be used to determine the median CQI values for stream #2 and stream #1, respectively. The stream and cell-specific BLER at a particular reported CQI is obtained by associating a particular CQI reference measurement period for all dual transport block CQI reports that were reported together with a PCI report that was matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2 with the two transport blocks of the HS-PDSCH subframe overlapping with the end of this COI reference measurement period and calculating the fractions of erroneous HS-PDSCH subframes to which the same CQI values were associated.

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Unit         | Test 1                                                                                                                                                                                                                                                                     | Test 2                        |

| <ul> <li>Note 1: Measurement power offset 'T' is configured by RRC accordingly and as defined in [7].</li> <li>Note 2: TF for HS-PDSCH is configured for each stream according to the reported CQI statistics. TF for each stream is based on median CQI over all dual transport block CQI reports that are reported together with a PCI report that is matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.6.2. Other physical channel parameters are configured according to the CQI mapping table described in TS25.214. The precoding that shall be used in the transmitter is one randomly picked but fixed precoding matrix for dual transport block transmission out of the set of possible precoding matrices as defined in [8]. The same precoding matrix shall be used to generate the resulting channel coefficients as described for MIMO dual stream conditions in subclause B.2.6.2.</li> </ul> |              |                                                                                                                                                                                                                                                                            |                               |
| <ul> <li>Note 3: HS-PDSCH Ec/lor is decreased according to reference power adjustment Δ described in TS 25.214</li> <li>Note 4: For any given transport format the power of the HS-SCCH and HS-PDSCH shall be transmitted continuously with constant power.</li> <li>Note 5: The UE shall be configured in 64QAM/MIMO mode and use appropriate CQI tables according to TS 25.214.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |              |                                                                                                                                                                                                                                                                            |                               |

#### Table 9.49BC: Test Parameters for CQI test in MIMO dual stream conditions

Table 9.49BD: Minimum requirement for CQI test in MIMO dual stream conditions

| Benerted COI   | Maximum BLER |        |
|----------------|--------------|--------|
| Reported CQI   | Test 1       | Test 2 |
| CQI median     | 60%          | 60%    |
| CQI median + 2 | 15%          | 15%    |

#### 9.3.4.3 MIMO Dual Stream Static Orthogonal Conditions

The minimum performance requirements of channel quality indicator (CQI) reporting under MIMO dual stream conditions are defined based on a Type A reporting fraction of 100%, i.e. the parameters  $N_{cqi_typeA}$  and  $M_{cqi}$  (see [8]) are assumed to be both set to 1. The propagation conditions assumed for minimum performance requirements of CQI reporting under MIMO dual stream static orthogonal conditions are defined in subclause B.2.6.3.

The precoding matrix used in the transmitter shall be one randomly picked but fixed precoding matrix  $\mathbf{W}$  out of the set defined in equation EQ.B.2.6.2.

#### 9.3.4.3.1 Minimum Requirement –UE HS-DSCH categories 15-20

For the parameters specified in Table 9.49C, and using the downlink physical channels specified in Table C.9 and Table C.12D, the reported CQI value, for each of the streams, shall be in the range of +/-2 of the reported stream specific CQI median more than 90% of the time. The stream specific CQI median shall be determined over all dual transport block CQI reports.

For each of the streams, if the HS-PDSCH BLER using the transport format indicated by the stream specific CQI median is less than or equal to 0.1, the BLER using the transport format indicated by the (stream specific CQI median + 2) shall be greater than 0.1. For each of the streams, if the HS-PDSCH BLER using the transport format indicated by the stream specific CQI median is greater than 0.1, the BLER using transport format indicated by (stream specific CQI median -1) shall be less than or equal to 0.1. The requirements are applicable to Test 1 and Test 2.

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Unit         | Test 1                                                                                                                                                                                                                                                                     | Test 2                        |

#### 9.3.4.3.2 Minimum Requirement –UE HS-DSCH categories 19-20

For the parameters specified in Table 9.49D, and using the downlink physical channels specified in Table C.9 and Table C.12D, the reported CQI value, for each of the streams, shall be in the range of +/-2 of the reported stream specific CQI median more than 90% of the time. The stream specific CQI median shall be determined over all dual transport block CQI reports.

For each of the streams, if the HS-PDSCH BLER using the transport format indicated by the stream specific CQI median is less than or equal to 0.1, the BLER using the transport format indicated by the (stream specific CQI median + 2) shall be greater than 0.1. For each of the streams, if the HS-PDSCH BLER using the transport format indicated by the stream specific CQI median is greater than 0.1, the BLER using transport format indicated by (stream specific CQI median -1) shall be less than or equal to 0.1. The requirements are applicable to Test 1 and Test 2.

#### Table 9.49D: Test Parameters for CQI test in MIMO dual stream static orthogonal conditions

#### 9.3.4.3.3 Additional Requirement – UE HS-DSCH categories 25-28, 30, 32 and 36

With a serving HS-DSCH cell and secondary serving HS-DSCH cell(s) configured, using the parameters specified in Table 9.49E, and using the downlink physical channels specified in Table C.9 and Table C.12D, the reported CQI value, for each of the streams, and cells shall be in the range of +/-2 of the reported stream specific CQI median more than 90% of the time. The requirement is applicable for each cell and stream individually, that is the median reported CQI, as well as corresponding BLERs, are to be separately determined for each cell and stream, and independently verified to fulfil the requirement. The stream and cell-specific CQI median shall be determined over all dual transport block CQI reports.

For each of the streams and cells, if the HS-PDSCH BLER using the transport format indicated by the stream and cell-specific CQI median is less than or equal to 0.1, the BLER using the transport format indicated by the (stream and cell-specific CQI median + 2) shall be greater than 0.1. For each of the streams and cells, if the HS-PDSCH BLER using the transport format indicated by the stream and cell-specific CQI median is greater than 0.1, the BLER using transport format indicated by (stream and cell-specific CQI median -1) shall be less than or equal to 0.1. The requirements are applicable to Test 1 and Test 2.

| Parameter                                                                                                                                                                                                                                                                                                                                           | Unit         | Test 1                                                                                                                                                                                                                                                         | Test 2                        |

#### Table 9.49E: Test Parameters for CQI test in MIMO dual stream static orthogonal conditions

#### 9.3.4.3.4 Additional Requirement – UE HS-DSCH categories 27, 28, 30, 32 and 36

With a serving HS-DSCH cell and secondary serving HS-DSCH cell(s) configured, using the parameters specified in Table 9.49F, and using the downlink physical channels specified in Table C.9 and Table C.12D, the reported CQI value, for each of the streams, and cells shall be in the range of +/-2 of the reported stream specific CQI median more than 90% of the time. The requirement is applicable for each cell and stream individually, that is the median reported CQI, as well as corresponding BLERs, are to be separately determined for each cell and stream, and independently verified to fulfil the requirement. The stream and cell-specific CQI median shall be determined over all dual transport block CQI reports.

For each of the streams and cells, if the HS-PDSCH BLER using the transport format indicated by the stream and cell-specific CQI median is less than or equal to 0.1, the BLER using the transport format indicated by the (stream and cell-specific CQI median + 2) shall be greater than 0.1. For each of the streams and cells, if the HS-PDSCH BLER using the transport format indicated by the stream and cell-specific CQI median is greater than 0.1, the BLER using transport format indicated by (stream and cell-specific CQI median -1) shall be less than or equal to 0.1. The requirements are applicable to Test 1 and Test 2.

#### Table 9.49EF: Test Parameters for CQI test in MIMO dual stream static orthogonal conditions

## 9.3.5 MIMO only with single-stream restriction Performance

### 9.3.5.1 MIMO only with single-stream restriction Fading Conditions

The propagation conditions assumed for minimum performance requirements of CQI reporting under MIMO single stream conditions are defined in subclause B.2.6.1. The precoding used at the transmitter is one randomly picked but fixed precoding vector for single transport block transmission out of the set of possible precoding vectors as defined in [8]. The same precoding vector shall be used to generate the resulting channel coefficients as described for MIMO single stream conditions in subclause B.2.6.1.

The reporting accuracy of CQI under MIMO with single-stream restriction is determined by the BLER performance when transmitting with a transport format indicated by the reported CQI median determined over all CQI reports that were reported together with PCI reports matching the precoding vector embedded in the propagation channel as defined in subclause B.2.6.1.

#### 9.3.5.1.1 Minimum Requirement

For the parameters specified in Table 9.49E1, and using the downlink physical channels specified in Table C.9 and Table C.12D, the requirements are specified in terms of maximum BLERs at particular reported CQIs when transmitting a fixed transport format given by the CQI median as shown in Table 9.4E2. The CQI median shall be determined over all CQI reports that were reported together with PCI reports matching the precoding vector embedded in the propagation channel as defined in subclause B.2.6.1. The BLER at a particular reported CQI is obtained by associating a particular CQI reference measurement period for all Type B CQI reports that were reported together with PCI reports matching the precoding vector embedded in the propagation channel as defined in subclause B.2.6.1.

HS-PDSCH subframe overlapping with the end of this CQI reference measurement period and calculating the fraction of erroneous HS-PDSCH subframes to which the same CQI value was associated.

| <ul> <li>Note 1: Measurement power offset 'Γ' is configured by RRC accordingly and as defined in [7].</li> <li>Note 2: TF for HS-PDSCH is configured according to the reported CQI statistics. TF based on median CQI over all Type B CQI reports that were reported together with PCI reports matching the precoding vector embedded in the propagation channel as defined in subclause B.2.6.1is used. Other physical channel parameters are configured according to the CQI mapping table described in TS25.214. The precoding that shall be used in the transmitter is one randomly picked but fixed precoding vector for single transport block transmission out of the set of possible precoding vectors as defined in [8]. The same precoding vector shall be used to generate the resulting channel coefficients as described for MIMO single stream conditions in subclause B.2.6.1.</li> <li>Note 3: HS-PDSCH Ec/lor is decreased according to reference power adjustment Δ described in TS 25.214.</li> <li>For any given transport format the power of the HS-SCCH and HS-PDSCH shall be transmitted continuously with constant power.</li> </ul> |              |                                                                                                                                                                                                                                                                            |                               |  |

### Table 9.49E1: Test Parameters for CQI test in MIMO single stream fading conditions

Table 9.49E2: Minimum requirement for CQI test in MIMO single stream conditions

| Reported CQI   | Maximum BLER |        |  |
|----------------|--------------|--------|--|
| Reported CQI   | Test 1       | Test 2 |  |
| CQI median     | 60%          | 60%    |  |
| CQI median + 3 | 15%          | 15%    |  |

### 9.3.6 Multiflow HSDPA performance

### 9.3.6.1 Fading propagation conditions

The reporting accuracy of the channel quality indicator (CQI) under fading environments is determined by the BLER performance using the transport format indicated by the reported CQI median.

The specified requirements may be subject to further simulations to verify assumptions.

### 9.3.6.1.1 Minimum Requirement

For the parameters specified in Table 9.49E3, and using the the test set-up in Annex C.5.5, the requirements are specified in terms of maximum BLERs at particular reported CQIs when transmitting a fixed transport format given by the CQI median as shown in Table 9.49E4. The BLER at a particular reported CQI is obtained by associating a particular CQI reference measurement period with the HS-PDSCH subframe of the time reference cell overlapping with the end of this CQI reference measurement period and calculating the fraction of erroneous HS-PDSCH subframes.

| Parameter                                                                                                                                                                                                                                                                                 | Unit         | Test 1                                                                                                                                                                                                                                                                                                                            |  |

Table 9.49E4: Minimum requirement for CQI test in fading – Multiflow HSDPA

| Reported CQI   | Maximum BLER |  |
|----------------|--------------|--|
| Reported CQI   | Test 1       |  |
| CQI median     | 60%          |  |
| CQI median + 3 | 15%          |  |

### 9.3.7 MIMO Performance with four transmit antennas

### 9.3.7.1 Four Streams Static Orthogonal Conditions

The minimum performance requirements of channel quality indicator (CQI) reporting under MIMO with four transmit antennas and four stream conditions are defined based on a Type A reporting fraction of 100%, i.e. the parameters  $N_{cqi_typeA}$  and  $M_{cqi}$  (see [8]) are assumed to be both set to 1. The propagation conditions assumed for minimum performance requirements of CQI reporting are defined in subclause B.2.7.

The precoding matrix used in the transmitter shall be one randomly picked but fixed precoding matrix  $\mathbf{W}$  out of the set defined in Annex B.2.7.

### 9.3.7.1.1 Minimum Requirement – UE HS-DSCH categories 37 and 38

With a serving HS-DSCH cell and secondary serving HS-DSCH cell(s) configured, using the parameters specified in Table 9.49E5, and using the downlink physical channels specified in C.12F, the reported CQI value, for each of the HARQ process, and cells shall be in the range of [+/-2] of the reported stream specific CQI median more than 90% of the time. The requirement is applicable for each cell and for each HARQ process individually, that is the median reported CQI, as well as corresponding BLERs, are to be separately determined for each cell and HARQ process, and independently verified to fulfil the requirement. The HARQ process and cell-specific CQI median shall be determined over all four transport block reports.

For each HARQ process and cells, if the HS-PDSCH BLER averaged over the streams associated to the same HARQprocess identifier, using the transport format indicated by the HARQ process and cell-specific CQI median is less than or equal to [0.1], the BLER using the transport format indicated by the HARQ process and cell-specific CQI median [+ 2] shall be greater than [0.1]. For each of the HARQ process and cells, if the HS-PDSCH BLER using the transport format indicated by the stream and cell-specific CQI median is greater than [0.1], the BLER using transport format indicated by the HARQ-process and cell-specific CQI median [-1] shall be less than or equal to [0.1].

| Parameter                                                                                                                                                                                                                                                                                                                                                                     | Unit                                                                                                                                                                                | Test 1                                                                      | Test 2                                                                                                                                                                                                                                                                            |  |

# Table 9.49E5: Test Parameters for CQI test for MIMO with four transmit antennas with four streams static orthogonal conditions

### 9.3.8 MIMO with Four Transmit Antennas only with Dual-Stream Restriction Performance

# 9.3.8.1 MIMO with four transmit antennas only with dual-stream restriction fading conditions

The propagation conditions assumed for minimum performance requirements of CQI reporting under MIMO with four transmit antennas with dual stream conditions are defined in subclause B.2.7.2. The precoding used at the transmitter is one randomly picked but fixed precoding vector for dual transport block transmission out of the set of possible precoding vectors as defined in [8]. The same precoding vector shall be used to generate the resulting channel coefficients as described in subclause B.2.7.2.

The reporting accuracy of CQI under MIMO with four transmit antennas with dual-stream restriction is determined by the BLER performance when transmitting with a transport format indicated by the reported CQI median determined

over all CQI reports that were reported together with PCI reports matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.7.2.

### 9.3.8.1.1 Minimum Requirement

With a serving HS-DSCH cell and secondary serving HS-DSCH cell(s) configured, using the parameters specified in Table 9.49E6, and using the downlink physical channels specified in Table C.12F, the requirements are specified in terms of maximum BLERs at particular reported CQIs for each HARQ process when transmitting a fixed transport format per HARQ process given by the HARQ process specific CQI median as shown in Table 9.49E7. The requirement is applicable for each cell and stream individually, that is the median reported CQI, as well as corresponding BLERs, are to be separately determined for each cell and stream, and independently verified against the requirement in Table 9.49E7. The HARQ process and cell-specific CQI median shall be determined over all dual transport block CQI reports that were reported together with PCI reports matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.7.2. The HARQ process and cell-specific BLER at a particular reported CQI is obtained by associating a particular CQI reference measurement period for all dual transport block CQI reports that were report that was matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.7.2 with the two transport blocks of the HS-PDSCH subframe overlapping with the end of this CQI reference measurement period and calculating the fractions of erroneous HS-PDSCH subframes to which the same CQI values were associated.

| <ul> <li>Note 1: Measurement power offset 'Γ' is configured by RRC accordingly and as defined in [7].</li> <li>Note 2: TF for HS-PDSCH is configured for each stream according to the reported CQI statistics. TF for each stream is based on median CQI over all dual transport block CQI reports that are reported together with a PCI report that is matching the precoding matrix embedded in the propagation channel as defined in subclause B.2.7.2. Other physical channel parameters are configured according to the CQI mapping table described in TS25.214. The precoding that shall be used in the transmitter is one randomly picked but fixed precoding matrix for dual transport block transmission out of the set of possible precoding matrices as defined in [8]. The same precoding matrix shall be used to generate the resulting channel coefficients as described for MIMO dual stream conditions in subclause B.2.7.2.</li> <li>Note 3: HS-PDSCH Ec/lor is decreased according to reference power adjustment Δ described in TS 25.214</li> <li>Note 4: For any given transport format the power of the HS-SCCH and HS-PDSCH shall be transmitted continuously with constant power.</li> <li>Note 5: The UE shall be configured in 64QAM/MIMO mode and use appropriate CQI tables according to TS</li> </ul> |              |                                                                                                                                                                                                                                                                |  |
| 25.214.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <u>.</u>     |                                                                                                                                                                                                                                                                |  |

## 9.4 HS-SCCH Detection Performance

The detection performance of the HS-SCCH is determined by the probability of event  $E_m$ , which is declared when the UE is signaled on HS-SCCH-1, but DTX is observed in the corresponding HS-DPCCH ACK/NACK field. The probability of event  $E_m$  is denoted  $P(E_m)$ .

### 9.4.1 HS-SCCH Type 1 Single Link Performance

For the test parameters specified in Table 9.50, for each value of HS-SCCH-1  $E_c/I_{or}$  specified in Table 9.51 and Table 9.51A the measured  $P(E_m)$  shall be less than or equal to the corresponding specified value of  $P(E_m)$ . Enhanced performance requirements type 1 specified in Table 9.51A are based on receiver diversity.

| Parameter                                | Unit     | Test 1                                                | Test 2            | Test 3          |

### 9.4.2 HS-SCCH Type 1 Open Loop Diversity Performance

For the test parameters specified in Table 9.52, for each value of HS-SCCH-1  $E_c/I_{or}$  specified in Table 9.53 and Table 9.54 the measured  $P(E_m)$  shall be less than or equal to the corresponding specified value of  $P(E_m)$ . Enhanced performance requirements type 1 specified in Table 9.54 are based on receiver diversity.

### 9.4.3 HS-SCCH Type 3 Performance

For the test parameters specified in Table 9.55 with the downlink physical channel setup in Table C.12, for each value of HS-SCCH-1  $E_c/I_{or}$  specified in Table 9.56 and Table 9.57 the measured  $P(E_m)$  shall be less than or equal to the corresponding specified value of  $P(E_m)$ . The requirements in Table 9.56 and Table 9.57 assume STTD is enabled on HS-SCCH and DPCH. The requirements in Table 9.56 assume HS-SCCH Type 3 coding associated with single stream transmission on HS-DSCH. The requirements in Table 9.57 assume HS-SCCH Type 3 coding associated with dual stream transmission on HS-DSCH.

For the test parameters specified in Table 9.55 with the downlink physical channel setup in Table C.12E, for each value of HS-SCCH-1  $E_c/I_{or}$  specified in Table 9.57a, Table 9.57b, Table 9.57c and Table 9.57d, the measured  $P(E_m)$  shall be less than or equal to the corresponding specified value of  $P(E_m)$ . The requirements in Table 9.57a and Table 9.57b assume STTD is disabled on HS-SCCH and DPCH. The requirements in Table 9.57c and Table 9.57d assume STTD is enabled on HS-SCCH and DPCH. The requirements in Table 9.57c assume HS-SCCH Type 3 coding associated with single stream transmission on HS-DSCH. The requirements in Table 9.57b and Table 9.57d assume HS-SCCH Type 3 coding associated with dual stream transmission on HS-DSCH.

Minimum performance requirements specified in Table 9.56, 9.57, 9.57a, 9.57b, 9.57c and 9.57d are based on receiver diversity.

| Parameter                          | Unit            | Test 1                                                               | Test 2                  | Test 3           | Test 4           |

# 9.4.4 HS-SCCH Type 3 Performance for MIMO only with single-stream restriction

For the test parameters specified in Table 9.57A1 with the downlink physical channel setup in Table C.12, for each value of HS-SCCH-1  $E_c/I_{or}$  specified in Table 9.57A2 and Table 9.57A3 the measured  $P(E_m)$  shall be less than or equal to the corresponding specified value of  $P(E_m)$ . The requirements in Table 9.57A2 and Table 9.57A3 assume STTD is enabled on HS-SCCH and DPCH. The requirements in Table 9.57A2 and Table 9.57A3 assume HS-SCCH Type 3 coding associated with single stream transmission on HS-DSCH. Performance requirements specified in Table 9.57A3 are based on receiver diversity.

For the test parameters specified in Table 9.57A1 with the downlink physical channel setup in Table C.12E, for each value of HS-SCCH-1  $E_c/I_{or}$  specified in Table 9.57A4, Table 9.57A5, Table 9.57A6 and Table 9.57A7, the measured  $P(E_m)$  shall be less than or equal to the corresponding specified value of  $P(E_m)$ . The requirements in Table 9.57A4 and Table 9.57A5 assume STTD is disabled on HS-SCCH and DPCH. The requirements in Table 9.57A6 and Table 9.57A7 assume STTD is enabled on HS-SCCH and DPCH. The requirements in Table 9.57A5, Table 9.57A6 and Table 9.57A6 and Table 9.57A6 and Table 9.57A6 and Table 9.57A7 assume HS-SCCH Type 3 coding associated with single stream transmission on HS-DSCH. Performance requirements specified in Table 9.57A5 and Table 9.57A7 are based on receiver diversity.

| Parameter                                | Unit            | Test 1                                                                                                                                                                                                                                          | Test 2                      |

### 9.4.5 HS-SCCH Type 4 Performance

For the test parameters specified in Table 9.57B1 with the downlink physical channel setup in Table C.12G, for each value of HS-SCCH-1  $E_c/I_{or}$  specified in Table 9.57B2 and Table 9.57B3 the measured  $P(E_m)$  shall be less than or equal to the corresponding specified value of  $P(E_m)$ . The requirements in Table 9.57B2 and Table 9.57B3 assume STTD is disabled on HS-SCCH and DPCH. The requirements in Table 9.57B2 assume HS-SCCH Type 4 coding associated with single stream transmission on HS-DSCH. The requirements in Table 9.57B3 assume HS-SCCH Type 4 coding associated with four stream transmission on HS-DSCH.

Minimum performance requirements specified in Table 9.57B1, 9.57B2 are based on receiver diversity.

### 9.4.6 HS-SCCH Type 4 Performance for MIMO mode with Four Transmit Antennas Only with Dual-stream Restriction

For the test parameters specified in Table 9.57B4 with the downlink physical channel setup in Table C.12G, for each value of HS-SCCH-1  $E_c/I_{or}$  specified in Table 9.57B5 and Table 9.57B6 the measured  $P(E_m)$  shall be less than or equal to the corresponding specified value of  $P(E_m)$ . The requirements in Table 9.57B5 and Table 9.57B6 assume STTD is disabled on HS-SCCH and DPCH. The requirements in Table 9.57B5 and Table 9.57B6 assume HS-SCCH Type 4

coding associated with dual stream transmission on HS-DSCH. Performance requirements specified in Table 9.57B5 and 9.57B6 are based on (dual branches) receiver diversity.

| Parameter                           | Unit            | Test 1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Test 2       | Test 3                       | Test 4 |

# 9.5 HS-SCCH-less demodulation of HS-DSCH (Fixed Reference Channel)

The receiver performance of the High Speed Physical Downlink Shared Channel (HS-DSCH) with HS-SCCH-less operation in multi-path fading environment is determined by the information bit throughput R.

The propagation conditions for this subclause are defined in table B.1C.

During the Fixed Reference Channel tests the behaviour of the Node-B emulator in response to the ACK/NACK signalling field of the HS-DPCCH is specified in Table 9.1A.

Performance requirements in this section assume sufficient power allocation to HS-SCCH\_1, so that the probability of detection failure, when the HS-SCCH-1 uses the identity of the UE under test, is very low.

### 9.5.1 Requirement QPSK, Fixed Reference Channel (FRC) H-Set 7

The requirements are specified in terms of a minimum information bit throughput R for the DL reference channels Hset 7 specified in Annex A.7.1.7, with the addition of the parameters in Table 9.58 and the downlink physical channel setup according to table C.8.

Using this configuration the throughput shall meet or exceed the minimum requirements specified in table 9.59. Enhanced performance requirements type 1 specified in Table 9.60 are based on receiver diversity.

| Parameter                                                                                                                                                                                                            | Unit         | Test 1  |  |  |

# 9.6 Requirements for HS-DSCH and HS-SCCH reception in CELL\_FACH state

The requirements determined in this section apply for UE being able to receive HS-DSCH and HS-SCCH in CELL\_FACH state.

### 9.6.1 HS-DSCH demodulation requirements (Single Link)

The receiver single link performance of the High Speed Physical Downlink Shared Channel (HS-DSCH) is determined by the RLC SDU error rate (RLC SDU ER).

### 9.6.1.1 Requirement QPSK, Fixed Reference Channel (FRC) H-Set 3

The requirements are specified in terms of a minimum RLC SDU error rate (RLC SDU ER) for the DL reference channel H-Set 3 (QPSK version) specified in A.7.1.3, with the addition of the parameters in Table 9.61 and the downlink physical channel setup according to Table C.12A. For the test parameters specified in Table 9.61, for the value of HS-DSCH-1  $E_c/I_{or}$  specified in Table 9.62 the measured RLC SDU ER shall be less than or equal to the corresponding specified value of RLC SDU ER.

| Test   | Propagation | Reference value     |                                  |  |
|--------|-------------|---------------------|----------------------------------|--|
| Number | Conditions  | HS-PDSCH RLC SDU ER |                                  |  |
|        |             | $E_c/I_{or}$ (dB)   | $\hat{I}_{or}$ / $I_{oc}$ = 0 dB |  |
| 1      | VA30        | -6                  | 0.82                             |  |

### 9.6.2 HS-SCCH Detection Performance

The detection performance of the HS-SCCH is determined by RLC SDU error rate (RLC SDU ER).

### 9.6.2.1 HS-SCCH Type 1 Single Link Performance

For the test parameters specified in Table 9.63, for the value of HS-SCCH-1  $E_c/I_{or}$  specified in Table 9.64 the measured RLC SDU ER shall be less than or equal to the corresponding specified value of RLC SDU ER. The downlink physical channel setup according to Table C.12B.

| Parameter                                | Unit            | Test 1                                                                                        | Test 2             | Test 3           |

## 10 Performance requirement (E-DCH)

### 10.1 General

The performance requirements for the UE in this subclause are specified for the propagation conditions specified in Annex B.2.2 and the Downlink Physical channels specified in Annex C.3.2.

Unless otherwise stated the receiver characteristics are specified at the antenna connector of the UE. For UE(s) with an integral antenna only, a reference antenna with a gain of 0 dBi is assumed. UE with an integral antenna may be taken into account by converting these power levels into field strength requirements, assuming a 0 dBi gain antenna. For UEs with more than one receiver antenna connector the fading of the signals and the AWGN signals applied to each receiver antenna connector shall be uncorrelated. The levels of the test signal applied to each of the antenna connectors shall be as defined in the respective sections below. Enhanced performance requirements Type 1 are based on receiver diversity.

## 10.2 Detection of E-DCH HARQ ACK Indicator Channel (E-HICH)

### 10.2.1 Single link performance

The receive characteristics of the E-DCH HARQ ACK Indicator Channel (E-HICH) in different multi-path fading environments are determined by the missed ACK and false ACK values.

### 10.2.1.1 Performance requirement

For the parameters specified in Table 10.1 the average downlink E-HICH  $E_c/I_{or}$  power ratio shall be below the specified value for the missed ACK probabilities in Table 10.2 and 10.3 for minimum performance requirements and Table 10.2A and 10.3A for enhanced performance requirements Type 1. For the parameters specified in Table 10.1 the false ACK probability shall be below the specified value in Table 10.4 and 10.5.

### 10.2.2 Detection in Inter-Cell Handover conditions

The receive characteristics of the E-DCH HARQ ACK Indicator Channel (E-HICH) is determined during an inter-cell soft handover by the missed ACK and false ACK error probabilities. During the soft handover a UE receives signals from different cells. A UE has to be able to detect E-HICH signalling from different cells belonging to different RLS, containing and not containing the Serving E-DCH cell.

### 10.2.2.1 Performance requirement for RLS not containing the Serving E-DCH cell

For the parameters specified in Table 10.6 the average downlink E-HICH  $E_c/I_{or}$  power ratio of cell belonging to RLS not containing the Serving E-DCH cell shall be below the specified value for the missed ACK probabilities in Table 10.7 and 10.8 for minimum performance requirements and Table 10.7A and 10.8A for enhanced performance requirements Type 1. For the parameters specified in Table 10.6 the false ACK probability shall be below the specified value in Table 10.9 and 10.10.

# Table 10.6: Requirement scenario parameters for E-HICH – cell belonging to RLS not containing the Serving E-DCH cell

| Parameter                                | Unit                                                                                  | Missed ACK                            | False ACK                   |  |  |

### 10.2.2.2 Performance requirement for RLS containing the serving E-DCH cell

For the parameters specified in Table 10.11 the average downlink E-HICH  $E_c/I_{or}$  power ratio of cell belonging to RLS containing the serving E-DCH cell shall be below the specified value for the missed ACK probabilities in Table 10.12 and 10.13 for minimum performance requirements and Table 10.12A and 10.13A for enhanced performance requirements Type 1. For the parameters specified in Table 10.11 the false ACK probability shall be below the specified value in Table 10.14 and 10.15.

| Parameter                               | Unit     | Missed ACK    | False ACK     |

## 10.3 Detection of E-DCH Relative Grant Channel (E-RGCH)

### 10.3.1 Single link performance

The receive characteristics of the E-DCH Relative Grant Channel (E-RGCH) in multi-path fading environment is determined by the missed UP/DOWN and missed HOLD.

### 10.3.1.1 Performance requirement

For the parameters specified in Table 10.16 the average downlink E-RGCH  $E_c/I_{or}$  power ratio shall be below the specified value for the missed UP/DOWN probabilities in Table 10.17 and 10.18 for minimum performance requirements and Table 10.17A and 10.18A for enhanced performance requirements Type 1. For the parameters specified in Table 10.16 the missed HOLD probability shall be below the specified value in Table 10.19 and 10.20.

Table 10.16: Requirement scenario parameters for E-RGCH – Serving E-DCH RLS

| Parameter                 | Unit     | Missed UP/DOWN | Missed HOLD |

### 10.3.2 Detection in Inter-Cell Handover conditions

The receive characteristics of the E-DCH Relative Grant Channel (E-RGCH) is determined during an inter-cell soft handover by the missed UP/DOWN and missed HOLD error probabilities. During the soft handover a UE receives signals from different cells. A UE has to be able to detect E-RGCH signalling from different cells, Serving E-DCH cell and Non-serving E-DCH RL.

### 10.3.2.1 Performance requirement for Non-serving E-DCH RL

For the parameters specified in Table 10.21 the missed HOLD probability shall be below the specified value in Table 10.22. For the parameters specified in Table 10.21 the average downlink E-RGCH  $E_c/I_{or}$  power ratio shall be below the specified value for the missed DOWN probabilities in Table 10.23 for minimum performance requirements and Table 10.23A for enhanced performance requirements Type 1.

# 10.3A Determination of common E-RGCH radio links in CELL\_FACH state

### 10.3A.1 Introduction

The requirements defined in this section are applicable to a UE supporting Common E-RGCH based interference control [7].

Uplink interference from E-DCH transmission in CELL\_FACH can be controlled based on the UE monitoring an E-RGCH channel from the neighboring cells. The UE determines the set of cells from candidate set for common E-RGCH monitoring by comparing CPICH\_Ec/No of the neighbor cell within a threshold of the serving cell CPICH\_Ec/No according to the procedure specified in [7]. The UE starts monitoring common E-RGCH from common E-RGCH radio link (RL).

### 10.3A.2 Requirements

# 10.3A.2.1 Determination when a cell for common E-RGCH RL has been already identified

This test case is targeting the scenario where UE has already been in CELL\_FACH state for a long enough time to identify candidate cells for common E-RGCH monitoring. The purpose of this test is to verify the amount of time for UE to determine common E-RGCH RL only without including a cell identification time, and to verify the missed down probability after determination.

The test parameters are given in Tables 10.23B and 10.23C below. The test consists of three successive time periods, with a time duration of T1, T2 and T3 respectively. During time duration T1, the UE shall not initiate PRACH preamble transmission for common E-DCH transmission. At the beginning of time duration T2, the UE shall initiate PRACH preamble transmission for common E-DCH transmission. During time duration T3, the common E-DCH resource shall be released.

NOTE: UE may not initiate PRACH preamble transmission for common E-DCH transmission exactly at the beginning of time duration T2.

Missed DOWN probability from Cell 2 shall be measured after 60 ms from initial PRACH preamble transmission until the end of time duration T2. Test shall be repeated to test common E-RGCH RL determination performance. The overall missed DOWN probability shall not exceed 5%. The overall missed down probability shall be measured over multiple repetitions of T2. If the UE fails to determine to monitor Cell 2 during a certain repetition of T1, T2, and T3, then the missed down probability for that repetition will be 100%.

| Parameter                                      | Unit          | Value              | Comment                                                              |

### 10.3A.2.2 Determination when a cell for common E-RGCH RL has not been identified

This test case is targeting the scenario where UE enters into CELL\_FACH and E-DCH resources are allocated immediately, before candidate cells for E-RGCH monitoring have been identified. The purpose of this test is to verify the amount of time for UE to determine common E-RGCH RL including the cell identification time for a candidate cell for common E-RGCH RL.

The test parameters are given in Tables 10.23D and 10.23E below. The test consists of two successive time periods, with a time duration of T1 and T2 respectively. At the beginning of time duration T1, the UE shall initiate PRACH preample transmission for common E-DCH transmission. During time duration T2, the common E-DCH resource shall be released.

NOTE: UE may not initiate PRACH preamble transmission for common E-DCH transmission exactly at the beginning of time duration T1.

Missed DOWN probability from Cell 2 shall be measured after 120 ms from initial PRACH preamble transmission until the end of time duration T1. Test shall be repeated to test common E-RGCH RL determination performance. The overall missed DOWN probability shall not exceed 24%. The overall missed down probability shall be measured over multiple repetitions of T1. If the UE fails to determine to monitor Cell 2 during a certain repletion of T1 and T2, then the missed down probability for that repetition will be 100%.

## 10.4 Demodulation of E-DCH Absolute Grant Channel (E-AGCH)

### 10.4.1 Single link performance

The receive characteristics of the E-DCH Absolute Grant Channel (E-AGCH) in multi-path fading environment is determined by the missed detection probability.

### 10.4.1.1 Performance requirement

For the parameters specified in Table 10.24 the average downlink E-AGCH  $E_c/I_{or}$  power ratio shall be below the specified value for the missed detection probability in Table 10.25 for minimum performance requirements and Table 10.25A for enhanced performance requirements Type 1.

| Parameter                                | Unit     | Missed detection |
|------------------------------------------|----------|------------------|

## 11 Performance requirement (MBMS)

Unless otherwise stated the receiver characteristics are specified at the antenna connector of the UE. For UE(s) with an integral antenna only, a reference antenna with a gain of 0 dBi is assumed. UE with an integral antenna may be taken into account by converting these power levels into field strength requirements, assuming a 0 dBi gain antenna. For UEs with more than one receiver antenna connector the fading of the signals and the AWGN signals applied to each receiver antenna connector shall be uncorrelated. The levels of the test signal applied to each of the antenna connectors shall be as defined in the respective sections below.

## 11.1 Demodulation of MCCH

The receive characteristic of the MCCH is determined by the RLC SDU error rate (RLC SDU ER). The requirement is valid for all RRC states for which the UE has capabilities for MBMS.

### 11.1.1 Minimum requirement

For the parameters specified in Table 11.1 the average downlink S-CCPCH\_ $E_c/I_{or}$  power ratio shall be below the specified value for the RLC SDU ER shown in Table 11.2.

| Parameter             | Unit         |          |
|-----------------------|--------------|----------|
|                       |              | Test 1   |
| Phase reference       | -            | P-CPICH  |
| I <sub>oc</sub>       | dBm/3.84 MHz | -60      |
| $\hat{I}_{or}/I_{oc}$ | dB           | -3       |
| MCCH Data Rate        |              | 7.6 kbps |
| Propagation condition |              | VA3      |

| 1           | -11.6                  | 0.01       |

### 11.1.2 Minimum requirement for MBSFN

Requirement in this subclause is applicable to UEs that are capable of receiving MBSFN with at least two receive antenna connectors.

For the parameters specified in Table 11.1a the average downlink S-CCPCH\_ $E_c/I_{or}$  power ratio shall be below the specified value for the RLC SDU ER shown in Table 11.2a.

| Table 11.1a: Parameters for | or MCCH detection |

### 11.2 Demodulation of MTCH

The receive characteristic of the MTCH is determined by RLC SDU error rate (RLC SDU ER). RLC SDU ER is specified for each individual data rate of the MTCH. The requirement is valid for all RRC states for which the UE has capabilities for MBMS.

### 11.2.1 Minimum requirement

For the parameters specified in Table 11.3 the average downlink S-CCPCH\_E<sub>c</sub> /I<sub>or</sub> power ratio shall be below the specified value for the RLC SDU ER shown in Table 11.4. If the UE supports optional enhanced performance requirements type1 for MBMS then for the parameters specified in Table 11.3 the average downlink S-CCPCH\_E<sub>c</sub> /I<sub>or</sub> power ratio shall be below the specified value for the RLC SDU ER shown in Table 11.4.

| Parameter                                           | Unit         | Test 1   | Test 2                       | Test 3                       |

| 3           | -11.5                  | 0.1        |

### 11.2.2 Minimum requirement for MBSFN

Requirement in this subclause is applicable to UEs that are capable of receiving MBSFN with at least two receive antenna connectors.

For the parameters specified in Table 11.3a the average downlink S-CCPCH\_ $E_c/I_{or}$  power ratio shall be below the specified value for the RLC SDU ER shown in Table 11.4a.

| Parameter                  | Unit            | Test 1                                  |
|----------------------------|-----------------|-----------------------------------------|
| Phase reference            | -               | P-CPICH                                 |
| I <sub>oc</sub>            | dBm/3.84<br>MHz | -60                                     |

## 11.3 Demodulation of MTCH and cell identification

MBMS combining is not controlled by a network but instead it is autonomously handled by a terminal. UE has to be able to receive MTCH and identify intra-frequency neighbour cells according to the requirements. The receive characteristic of the MTCH combined with cell identification is determined by RLC SDU error rate (RLC SDU ER).

### 11.3.1 Minimum requirement

For the parameters specified in Table 11.5 the average downlink S-CCPCH\_ $E_c/I_{or}$  power ratio shall be below the specified value for the RLC SDU error rate shown in Table 11.6. The cell reselection parameters are given in clause A.9 in Table A.34. The different cells are assumed to be time aligned.

| Parameter                    | Unit         | Test 1      |         |           |
|------------------------------|--------------|-------------|---------|-----------|

## Annex A (normative): Measurement channels

## A.1 General

The measurement channels in this annex are defined to derive the requirements in clauses 6, 7 and 8. The measurement channels represent example configuration of radio access bearers for different data rates.

The measurement channel for 12.2 kbps shall be supported by any UE both in up- and downlink. Support for other measurement channels is depending on the UE Radio Access capabilities.

## A.2 UL reference measurement channel

### A.2.1 UL reference measurement channel (12.2 kbps)

The parameters for the 12.2 kbps UL reference measurement channel are specified in Table A.1 and Table A.2. The channel coding for information is shown in figure A.1.

### Table A.1: UL reference measurement channel physical parameters (12.2 kbps)

|                                                                                                                                                                                | Parameter       | Unit | Level |

# A.2.6 UL E-DCH reference measurement channel for DC-HSUPA using BPSK modulation

The parameters for the UL measurement channel for UE transmitter characteristics for DC-HSUPA are specified in Table A.10AA and Figure A.4AA. The power imbalance in Table A.10AA refers to the ratio of the DPCCH power of the primary uplink frequency to the DPCCH power of the secondary uplink frequency, expressed in dB.

### Table A.10AA: Settings for DC-HSUPA reference measurement channel using BPSK modulation

| Parameter                                                                                    | Unit        | Value |
|----------------------------------------------------------------------------------------------|-------------|-------|
| Modulation                                                                                   |             | BPSK  |
| Maximum. Inf. Bit Rate                                                                       | kbps        | 60    |

|                                                                     | physical channel |           |
| E-DPDCH/DPCCH power ratio, SF4 codes                                | dB               | 16.03     |
| E-DPDCH/DPCCH power ratio, SF2 codes                                | dB               | 19.02     |
| E-DPCCH/DPCCH power ratio                                           | dB               | 8.07      |
| HS-DPCCH/DPCCH power ratio                                          | dB               | 2.05      |
| Power imbalance                                                     | dB               | 0         |
| Note: HS-DPCCH is applicable only for the primary uplink frequency. |                  |           |

Figure A.4AB: E-DPDCH coding rate for DC-HSUPA reference measurement channel using 16QAM modulation

# A.2.8 Combinations of UL E-DCH reference measurement channel for DC-HSUPA tests

The combinations of BPSK and 16QAM reference measurement channels in Table A.10AC shall be used for verifying the UE maximum output power for DC-HSUPA, additional Spectrum emission mask for DC-HSUPA, and additional ACLR requirement for DC-HSUPA. The entry BPSK in Table A.10AC refers to the UL E-DCH reference measurement channel for DC-HSUPA using BPSK modulation, specified in subclause A.2.6, and the entry 16QAM refers to the UL E-DCH reference measurement channel for DC-HSUPA using 16QAM modulation, specified in subclause A.2.7. The power imbalance in subclause A.2.6 and A.2.7 have been adjusted as shown in Table A.10AC.

#### Table A.10AC: Settings for DC-HSUPA reference measurement channels for UE maximum output power, spectrum emission mask and ACLR requirements

| Config<br># | Primary<br>carrier | Secondar<br>y carrier | Power<br>imbalance<br>[dB] | Allowed<br>MPR<br>[dB] |
|-------------|--------------------|-----------------------|----------------------------|------------------------|
| 1           | BPSK               | BPSK                  | -10                        | [0.5]                  |
| 2           | BPSK               | BPSK                  | 8                          | [1.0]                  |
| 3           | BPSK               | BPSK                  | 0                          | [1.5]                  |
| 4           | 16QAM              | 16QAM                 | 0                          | [TBD]                  |

## A.3 DL reference measurement channel

## A.3.0 DL reference measurement channel (0 kbps)

The parameters for the 0 kbps DL reference measurement channel are specified in Table A.10A and Table A.10B. The channel coding is shown for information in figure A.4A.

| Parameter                      | Unit | Level |
|--------------------------------|------|-------|
| Information bit rate           | kbps | 0     |
| DPCH                           | ksps | 30    |
| Slot Format #I                 | -    | 11    |
| TFCI                           | -    | On    |
| Power offsets PO1, PO2 and PO3 | dB   | 0     |
| Puncturing                     | %    | 13.9  |

# A.4A Reference parameters for discontinuous UL DPCCH transmission

The parameters for the UE UL power control operation with discontinuous UL DPCCH transmission test is specified in Table A.20A. Same parameter values are used for 2ms and 10ms E-DCH TTI.

#### Table A.20A: Parameters for the discontinuous UL DPCCH transmission

| Parameter                              | Unit         | Level |
|----------------------------------------|--------------|-------|
| Enabling_Delay                         | Radio frames | 0     |
| UE_DTX_cycle_1                         | Subframes    | 10    |
| UE_DTX_cycle_2                         | Subframes    | 10    |
| UE_DTX_DRX_offset                      | Subframes    | 0     |
| Inactivity_threshold_for_UE_DTX_cycle2 | E-DCH TTI    | 1     |
| UE_DPCCH_burst_1                       | Subframes    | 1     |
| UE_DPCCH_burst_2                       | Subframes    | 1     |
| UE_DTX_long_preamble_length            | Slots        | 2     |
| CQI Feedback cycle, k                  | Milliseconds | 0     |
| CQI_DTX_TIMER                          | Subframes    | 0     |

Table A.20B: (void)

Figure A.11A (void)

## A.5 DL reference compressed mode parameters

Parameters described in Table A.21 are used in some test specified in TS 25.101 while parameters described in Table A.22 and Table A.22A are used in some tests specified in TS 25.133.

Parameters in Table A.21 are applicable when compressed mode by spreading factor reduction is used in downlink.

| Parameter                                     | Set 1   | Set 2   | Note                      |
|-----------------------------------------------|---------|---------|---------------------------|
| TGSN (Transmission Gap Starting Slot Number)  | 11      | 4       |                           |
| TGL1 (Transmission Gap Length 1)              | 7       | 7       |                           |
| TGL2 (Transmission Gap Length 2)              | -       | 7       | Only one gap in use.      |
| TGD (Transmission Gap Distance)               | 0       | 15      | Only one gap in use.      |
| TGPL1 (Transmission Gap Pattern Length)       | 4       | 4       |                           |
| TGPRC (Transmission Gap Pattern Repetition    | NA      | NA      | Defined by higher layers  |
| Count)                                        |         |         |                           |
| TGCFN (Transmission Gap Connection Frame      | NA      | 0       | Defined by higher layers  |
| Number):                                      |         |         |                           |
| UL/DL compressed mode selection               | DL & UL | DL & UL | 2 configurations possible |
|                                               |         |         | DL &UL / DL               |
| UL compressed mode method                     | SF/2    | SF/2    |                           |
| DL compressed mode method                     | SF/2    | SF/2    |                           |
| Downlink frame type and Slot format           | 11B     | 11B     |                           |
| Scrambling code change                        | No      | No      |                           |
| RPP (Recovery period power control mode)      | 0       | 0       |                           |
| ITP (Initial transmission power control mode) | 0       | 0       |                           |

#### Table A.21: Compressed mode reference pattern 1 parameters

| Parameter                                            | Set 1   | Set 2   | Set 4      | Set 5   | Note                                          |

## A.6 DL reference parameters for PCH tests

The parameters for the PCH demodulation tests are specified in Table A.23 and Table A.24.

#### Table A.23: Physical channel parameters for S-CCPCH

| Parameter                       | Unit | Level |
|---------------------------------|------|-------|
| Channel bit rate                | kbps | 60    |
| Channel symbol rate             | ksps | 30    |
| Slot Format #i                  | -    | 4     |
| TFCI                            | -    | OFF   |
| Power offsets of TFCI and Pilot | dB   | 0     |
| fields relative to data field   |      |       |

#### Table A.24: Transport channel parameters for S-CCPCH

| Parameter                       | PCH                |
|---------------------------------|--------------------|
| Transport Channel Number        | 1                  |
| Transport Block Size            | 240                |
| Transport Block Set Size        | 240                |
| Transmission Time Interval      | 10 ms              |
| Type of Error Protection        | Convolution Coding |
| Coding Rate                     | 1/2                |
| Rate Matching attribute         | 256                |
| Size of CRC                     | 16                 |
| Position of TrCH in radio frame | fixed              |

## A.7 DL reference channel parameters for HSDPA tests

A.7.1 Fixed Reference Channel (FRC)

## A.7.1.1 Fixed Reference Channel Definition H-Set 1/1A/1B/1C/1E

#### Table A.25: Fixed Reference Channel H-Set 1/1A/1B/1C/1E

|           | Parameter                                          | Unit         | Va           | lue        |
|-----------|----------------------------------------------------|--------------|--------------|------------|
| Nominal   | Avg. Inf. Bit Rate                                 | kbps         | 534          | 777        |
| Inter-TTI | Distance                                           | TTI"s        | 3            | 3          |
| Number    | of HARQ Processes                                  | Proces       | 2            | 2          |
|           |                                                    | ses          | -            | -          |
| Informati | on Bit Payload ( $N_{INF}$ )                       | Bits         | 3202         | 4664       |
| Number    | Code Blocks                                        | Blocks       | 1            | 1          |
| Binary C  | hannel Bits Per TTI                                | Bits         | 4800         | 7680       |
| Total Ava | ailable SML"s in UE                                | SML"s        | 19200        | 19200      |
| Number    | of SML"s per HARQ Proc.                            | SML"s        | 9600         | 9600       |
| Coding F  | Rate                                               |              | 0.67         | 0.61       |
| Number    | of Physical Channel Codes                          | Codes        | 5            | 4          |
| Modulati  | on                                                 |              | QPSK         | 16QAM      |
| Note:     | The HS-DSCH shall be transmitte                    | d continuo   | usly with co | onstant    |
|           | power but only every third TTI sha                 | II be alloca | ted to the   | UE         |
|           | under test. The values in the table                | defines H-   | Set 1. H-S   | Set 1A for |
|           | DC-HSDPA and DB-DC-HSDPA is                        |              |              |            |
|           | to each of the carriers available in               | DC-HSDP      | A and DB-    | DC-        |
|           | HSDPA mode. H-Set 1B and H-Set 1C for 4C-HSDPA are |              |              |            |
|           | formed by applying H-Set 1 to eac                  |              |              |            |
|           | 4C-HSDPA mode (3 carriers for H                    |              |              |            |
|           | Set 1C). H-Set 1E for 8C-HSDPA                     | is formed b  | by applying  | H-Set 1    |
|           | to each of the carriers available in               | 8C-HSDP      | A mode.      |            |

#### Table A.34: Cell reselection parameters

## Annex B (normative) : Propagation conditions

## B.1 (void)

## B.2 Propagation Conditions

## B.2.1 Static propagation condition

The propagation for the static performance measurement is an Additive White Gaussian Noise (AWGN) environment. No fading and multi-paths exist for this propagation model.

## B.2.2 Multi-path fading propagation conditions

Table B1 shows propagation conditions that are used for the performance measurements in multi-path fading environment. All taps have classical Doppler spectrum.

Table B.1: Propagation Conditions for Multi path Fading Environments (Cases 1 to 6)

NOTE 1: Case 5 is only used in TS25.133.

NOTE 2: Speed above 250km/h is applicable to demodulation performance requirements only.

#### Table B.1A (void)

Table B.1B shows propagation conditions that are used for HSDPA performance measurements in multi-path fading environment. For HSDPA and DCH enhanced performance requirements, the fading of the signals and the AWGN signals provided in each receiver antenna port shall be independent. For DC-HSDPA requirements, the fading of the signals for each cell shall be independent.

#### Table B.1B: Propagation Conditions for Multi-Path Fading Environments for HSDPA Performance Requirements

NOTE 1: Speed above 120km/h is applicable to demodulation performance requirements only.

Table B.1C shows propagation conditions that are used for CQI test in multi-path fading and HS-SCCH-less demodulation of HS-DSCH. For HSDPA enhanced performance requirements, the fading of the signals and the AWGN signals provided in each receiver antenna port shall be independent. For DC-HSDPA requirements, the fading of the signals for each cell shall be independent.

# Table B.1E: Propagation Conditions for Multi-Path Fading Environments for MBSFN Demodulation Performance Requirements

## B.2.3 Moving propagation conditions

The dynamic propagation conditions for the test of the baseband performance are non fading channel models with two taps. The moving propagation condition has two tap, one static, Path0, and one moving, Path1. The time difference between the two paths is according Equation (B.1). The taps have equal strengths and equal phases.

Figure B.1: The moving propagation conditions

$$\Delta \tau = B + \frac{A}{2} \left( 1 + \sin(\Delta \omega \cdot t) \right) \tag{B.1}$$

The parameters in the equation are shown in the following table.

| Table | <b>B.2</b> |
|-------|------------|
|-------|------------|

| Parameter | Value                               |
|-----------|-------------------------------------|
| А         | 5 μs                                |
| В         | 1 μs                                |
| Δω        | 40*10 <sup>-3</sup> s <sup>-1</sup> |

## B.2.4 Birth-Death propagation conditions

The dynamic propagation conditions for the test of the base band performance is a non fading propagation channel with two taps. The moving propagation condition has two taps, Path1 and Path2 which alternate between "birth" and "death". The positions the paths appear are randomly selected with an equal probability rate and is shown in Figure B.2.

Figure B.2: Birth death propagation sequence

- 1. Two paths, Path1 and Path2 are randomly selected from the group[-5,-4,-3,-2,-1,0,1,2,3,4,5] μs. The paths have equal magnitudes and equal phases.
- 2. After 191 ms, Path1 vanishes and reappears immediately at a new location randomly selected from the group [-5,-4,-3,-2,-1,0,1,2,3,4,5] μs but excludes the point Path 2. The magnitudes and the phases of the tap coefficients of Path 1 and Path 2 shall remain unaltered.
- 3. After an additional 191 ms, Path2 vanishes and reappears immediately at a new location randomly selected from the group [-5,-4,-3,-2,-1,0,1,2,3,4,5] μs but excludes the point Path 1. The magnitudes and the phases of the tap coefficients of Path 1 and Path 2 shall remain unaltered.

The sequence in 2) and 3) is repeated.

## B.2.5 High speed train condition

The high speed train condition for the test of the baseband performance is a non fading propagation channel with one tap. Doppler shift is given by

$$f_s(t) = f_d \cos \theta(t) \tag{B.2}$$

where  $f_s(t)$  is the Doppler shift and  $f_d$  is the maximum Doppler frequency. The cosine of angle  $\theta(t)$  is given by

$$\cos\theta(t) = \frac{D_s/2 - vt}{\sqrt{D_{\min}^2 + (D_s/2 - vt)^2}}, \ 0 \le t \le D_s/v$$
(B.3)

$$\cos\theta(t) = \frac{-1.5D_s + vt}{\sqrt{D_{\min}^2 + (-1.5D_s + vt)^2}}, \ D_s/v < t \le 2D_s/v$$
(B.4)

$$\cos\theta(t) = \cos\theta(t \mod (2D_s/v)), \ t > 2D_s/v \tag{B.5}$$

where  $D_s/2$  is the initial distance of the train from BS, and  $D_{\min}$  is BS-Railway track distance, both in meters; v is the velocity of the train in m/s, t is time in seconds.

Doppler shift and cosine angle is given by equation B.2 and B.3-B.5 respectively, where the required input parameters listed in table B.3 and the resulting Doppler shift shown in Figure B.3 are applied for all frequency bands.

| Parameter  | Value    |  |
|------------|----------|--|
| $D_s$      | 300 m    |  |
| $D_{\min}$ | 2 m      |  |
| v          | 300 km/h |  |
| $f_d$      | 600 Hz   |  |

Table B.3

NOTE1: Parameters for HST conditions in table B.3 including  $f_d$  and Doppler shift trajectories presented on figure B.3 were derived for Band1.

Figure B.3: Doppler shift trajectory

### B.2.6 MIMO propagation conditions

MIMO propagation conditions are defined for a 2x2 antenna configuration. The resulting propagation channel shall be characterized by a complex 2x2 matrix termed

$$\mathbf{H} = \begin{pmatrix} h_{11} & h_{12} \\ h_{21} & h_{22} \end{pmatrix}.$$

The channel coefficients of  $\mathbf{H}$  shall be defined as a function of the possible precoding vectors or matrices. The possible precoding vectors for MIMO operation according to [8] shall be termed

$$\mathbf{w}^{(1)} = \begin{pmatrix} \frac{1}{\sqrt{2}} \\ \frac{1+j}{2} \end{pmatrix}, \quad \mathbf{w}^{(2)} = \begin{pmatrix} \frac{1}{\sqrt{2}} \\ \frac{1-j}{2} \end{pmatrix}, \quad \mathbf{w}^{(3)} = \begin{pmatrix} \frac{1}{\sqrt{2}} \\ \frac{-1+j}{2} \end{pmatrix}, \quad \mathbf{w}^{(4)} = \begin{pmatrix} \frac{1}{\sqrt{2}} \\ \frac{-1-j}{2} \end{pmatrix}$$
(EQ.B.2.6.1)

In what follows. Furthermore the following possible precoding matrices shall be defined:

 $\mathbf{W}^{(1)} = \begin{pmatrix} \mathbf{w}^{(1)} & \mathbf{w}^{(4)} \end{pmatrix}, \quad \mathbf{W}^{(2)} = \begin{pmatrix} \mathbf{w}^{(2)} & \mathbf{w}^{(3)} \end{pmatrix}, \quad \mathbf{W}^{(3)} = \begin{pmatrix} \mathbf{w}^{(3)} & \mathbf{w}^{(2)} \end{pmatrix}, \quad \mathbf{W}^{(4)} = \begin{pmatrix} \mathbf{w}^{(4)} & \mathbf{w}^{(1)} \end{pmatrix} \quad (EQ.B.2.6.2)$ 

#### B.2.6.1 MIMO Single Stream Fading Conditions

For MIMO single stream conditions, the resulting propagation channel shall be generated using two independent fading processes with classical Doppler and one randomly picked but fixed precoding vector  $\mathbf{w}$  out of the set defined in equation EQ.B.2.6.1. The two fading processes shall be generated according to the parameters in Table B.4

| MIMO Single Stream Conditions,           |                              |                    |  |  |  |
|------------------------------------------|------------------------------|--------------------|--|--|--|
| Speed for                                | Band I, II, III, IV, IX, X a | nd XXV: 3km/h      |  |  |  |
|                                          | and V, VI, VIII, XIX, XX a   |                    |  |  |  |
| -                                        | Speed for Band VII: 2.3      | km/h               |  |  |  |
| Speed for Band XI, XXI: 4.1km/h          |                              |                    |  |  |  |
| Speed for Band XII, XIII and XIV: 8 km/h |                              |                    |  |  |  |
| Speed for Band XXII: 1.7 km/h            |                              |                    |  |  |  |
| Relative Delay                           | Relative Mean                | (Amplitude, phase) |  |  |  |
| [ns] Power [dB] symbols                  |                              |                    |  |  |  |
| $0 \qquad 0 \qquad (a_1, \varphi_1)$     |                              |                    |  |  |  |
| 0                                        | $(a_2, \varphi_2)$           |                    |  |  |  |

Table B.4

NOTE: The amplitude  $a_2$  is not used in tests under MIMO single stream conditions, only the phase  $\varphi_2$  will be used.

The channel coefficients of the resulting propagation channel under MIMO single stream condiitons shall be given by

$$\mathbf{H} = \begin{pmatrix} h_{11} & h_{12} \\ h_{21} & h_{22} \end{pmatrix} = a_1 \cdot \begin{pmatrix} \exp(\mathbf{j} \cdot \boldsymbol{\varphi}_1) \\ \exp(-\mathbf{j} \cdot \boldsymbol{\varphi}_2) \end{pmatrix} \cdot \mathbf{w}^{\mathrm{H}}$$

The generation of the resulting channel coefficients for MIMO single stream conditions and the association with the transmitter and receiver ports are depicted Figure B.4. Figure B.4 does not restrict test system implementation.

#### B.2.6.2 MIMO Dual Stream Fading Conditions

For MIMO dual stream conditions, the resulting propagation channel shall be generated using two independent fading processes with classical Doppler and one randomly picked but fixed precoding matrix  $\mathbf{W}$  out of the set defined in equation EQ.B.2.6.2. The two fading processes shall be generated according to the parameters in Table B.5

| MIMO Dual Stream Conditions,             |                                                     |                        |  |  |
|------------------------------------------|-----------------------------------------------------|------------------------|--|--|
| Speed for                                | Speed for Band I, II, III, IV, IX, X and XXV: 3km/h |                        |  |  |
| Speed for Ba                             | and V, VI, VIII, XIX, XX a                          | and XXVI: 7.1km/h      |  |  |
|                                          | Speed for Band VII: 2.3km/h                         |                        |  |  |
| S                                        | Speed for Band XI, XXI: 4.1km/h                     |                        |  |  |
| Speed for Band XII, XIII and XIV: 8 km/h |                                                     |                        |  |  |
| Speed for Band XXII: 1.7 km/h            |                                                     |                        |  |  |
| Relative Delay                           | Relative Mean                                       | (Amplitude, phase)     |  |  |
| [ns]                                     | symbols                                             |                        |  |  |
| 0                                        | 0                                                   | $(a_1^{}, arphi_1^{})$ |  |  |
| 0                                        | -3                                                  | $(a_2, \varphi_2)$     |  |  |

Table B.5

The channel coefficients of the resulting propagation channel under MIMO dual stream condiitons shall be given by

$$\mathbf{H} = \begin{pmatrix} h_{11} & h_{12} \\ h_{21} & h_{22} \end{pmatrix} = \sqrt{\frac{2}{3}} \begin{pmatrix} \exp(\mathbf{j} \cdot \boldsymbol{\varphi}_1) & \exp(\mathbf{j} \cdot \boldsymbol{\varphi}_2) \\ \exp(-\mathbf{j} \cdot \boldsymbol{\varphi}_2) & -\exp(-\mathbf{j} \cdot \boldsymbol{\varphi}_1) \end{pmatrix} \cdot \begin{pmatrix} a_1 & 0 \\ 0 & a_2 \end{pmatrix} \cdot \mathbf{W}^{\mathrm{H}}$$

The generation of the resulting channel coefficients for MIMO dual stream conditions and the association with the transmitter and receiver ports are depicted Figure B.5. Figure B.5 does not restrict test system implementation.

Figure B.5: Test setup under MIMO Dual Stream Fading Conditions

#### B.2.6.3 MIMO Dual Stream Static Orthogonal Conditions

The channel coefficients of the resulting propagation channel under MIMO dual stream condiitons shall be given by

$$\mathbf{H} = \begin{pmatrix} h_{11} & h_{12} \\ h_{21} & h_{22} \end{pmatrix} = \begin{pmatrix} 1 & 1 \\ 1 & -1 \end{pmatrix}$$

The generation of the resulting channel coefficients for MIMO dual stream conditions and the association with the transmitter and receiver ports are depicted Figure B.6. Figure B.6 does not restrict test system implementation.

Figure B.6: Test setup under MIMO Dual Stream Static Orthogonal Conditions

# B.2.7 Propagation conditions for MIMO with four transmit antennas

The propagation conditions for MIMO with four transmit antennas are defined for a 4x4 antenna configuration. The resulting propagation channel shall be characterized by a complex 4x4 matrix termed

$$\mathbf{H} = \begin{pmatrix} h_{11} & h_{12} & h_{13} & h_{14} \\ h_{21} & h_{22} & h_{23} & h_{24} \\ h_{31} & h_{32} & h_{33} & h_{34} \\ h_{41} & h_{42} & h_{43} & h_{44} \end{pmatrix}$$

The channel coefficients of  $\mathbf{H}$  shall be defined as a function of the possible precoding matrices. The possible precoding matrices for MIMO operation with four transmit antennas according to [8] are obtained by the quantity

 $\mathbf{W} = W_n^{\{s\}}$  which denotes the matrix defined by the columns given by the set  $\{s\}$  from the expression

 $W_n = I - 2u_n u_n^H / u_n^H u_n$  where *I* is the 4×4 identity matrix and the vector  $u_n$  is given in [8], Table 14B.7.

#### B.2.7.1 MIMO with Four Transmit Antennas and Four Streams Static Orthogonal Conditions

The channel coefficients of the resulting propagation channel under MIMO with four transmit antennas and four stream conditions shall be given by

The generation of the resulting channel coefficients for MIMO with four transmit antennas and four stream conditions and the association with the transmitter and receiver ports can be derived from Figure B.4 with the application of the above mentioned coefficients. Figure B.4 does not restrict test system implementation.

#### B.2.7.2 MIMO with Four Transmit Antennas Only With Dual Stream Fading Conditions

For MIMO with four transmit antennas and dual stream conditions, the resulting propagation channel shall be generated using two independent fading processes with classical Doppler and one randomly picked but fixed precoding matrix

Table B.8

W out of the set defined in Section B.2.7 with two transport blocks. The two fading processes shall be generated according to the parameters in Table B.8.

| M                                        | MIMO Dual Stream Conditions,  |                    |  |  |  |
|------------------------------------------|-------------------------------|--------------------|--|--|--|
| Speed for                                | Band I, II, III, IV, IX, X a  | nd XXV: 3km/h      |  |  |  |
| Speed for Ba                             | and V, VI, VIII, XIX, XX a    | and XXVI: 7.1km/h  |  |  |  |
|                                          | Speed for Band VII: 2.3       | km/h               |  |  |  |
| S                                        | peed for Band XI, XXI: 4      | l.1km/h            |  |  |  |
| Speed for Band XII, XIII and XIV: 8 km/h |                               |                    |  |  |  |
|                                          | Speed for Band XXII: 1.7 km/h |                    |  |  |  |
| Relative Delay                           | Relative Mean                 | (Amplitude, phase) |  |  |  |
| [ns]                                     |                               |                    |  |  |  |
| 0                                        | $(a_1, arphi_1)$              |                    |  |  |  |
| 0                                        | -3                            | $(a_2, \varphi_2)$ |  |  |  |

The channel coefficients of the resulting propagation channel under MIMO with four transmit antennas and dual stream conditions shall be given by

$$\mathbf{H} = \begin{pmatrix} h_{11} & h_{12} & h_{13} & h_{14} \\ h_{21} & h_{22} & h_{23} & h_{24} \end{pmatrix} = \sqrt{\frac{2}{3}} \begin{pmatrix} \exp(\mathbf{j} \cdot \boldsymbol{\varphi}_1) & \exp(\mathbf{j} \cdot \boldsymbol{\varphi}_2) \\ \exp(-\mathbf{j} \cdot \boldsymbol{\varphi}_2) & -\exp(-\mathbf{j} \cdot \boldsymbol{\varphi}_1) \end{pmatrix} \cdot \begin{pmatrix} a_1 & 0 \\ 0 & a_2 \end{pmatrix} \cdot \mathbf{W}^{\mathrm{H}}$$

Where  $\mathbf{W}^{H}$  is a 2x4 matrix. The generation of the resulting channel coefficients for MIMO with four transmit antennas and dual stream conditions and the association with the transmitter and receiver ports can be derived from Figure B.5 with the appropriate changes to the matrix dimensions (**W**). Figure B.5 does not restrict test system implementation.

# Annex C (normative): Downlink Physical Channels

### C.1 General

This annex specifies the downlink physical channels that are needed for setting a connection and channels that are needed during a connection.

# C.2 Connection Set-up

Table C.1 describes the downlink Physical Channels that are required for connection set up.

| Physical Channel |
|------------------|
| P-CPICH          |
| P-CCPCH          |
| SCH              |
| S-CCPCH          |
| PICH             |
| AICH             |
| DPCH             |
|                  |

#### Table C.1: Downlink Physical Channels required for connection set-up

# C.3 During connection

The following clauses, describes the downlink Physical Channels that are transmitted during a connection i.e., when measurements are done. For these measurements the offset between DPCH and SCH shall be zero chips at Node B meaning that SCH is overlapping with the first symbols in DPCH in the beginning of DPCH slot structure.

### C.3.1 Measurement of Rx Characteristics

Table C.2 is applicable for measurements on the Receiver Characteristics (clause 7) with the exception of subclause 7.4 (Maximum input level).

| Physical Channel | Power ratio                 |
|------------------|-----------------------------|
| P-CPICH          | P-CPICH_Ec / DPCH_Ec = 7 dB |
| P-CCPCH          | P-CCPCH_Ec / DPCH_Ec = 5 dB |
| SCH              | SCH_Ec / DPCH_Ec = 5 dB     |
| PICH             | PICH_Ec / DPCH_Ec = 2 dB    |
| DPCH             | Test dependent power        |

### C.3.2 Measurement of Performance requirements

Table C.3 is applicable for measurements on the Performance requirements (clause 8), including subclause 7.4 (Maximum input level) and subclause 6.4.4 (Out-of-synchronization handling of output power).

| Physical Channel                                                                                                  | Power ratio             | NOTE                                                                                                                                                                                                             |
|-------------------------------------------------------------------------------------------------------------------|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| P-CPICH                                                                                                           | P-CPICH_Ec/lor = -10 dB | Use of P-CPICH or S-CPICH as phase<br>reference is specified for each<br>requirement and is also set by higher<br>layer signalling.                                                                              |
| S-CPICH                                                                                                           | S-CPICH_Ec/lor = -10 dB | When S-CPICH is the phase reference in<br>a test condition, the phase of S-CPICH<br>shall be 180 degrees offset from the<br>phase of P-CPICH. When S-CPICH is not<br>the phase reference, it is not transmitted. |
| P-CCPCH                                                                                                           | P-CCPCH_Ec/lor = -12 dB | When BCH performance is tested the P-<br>CCPCH_Ec/lor is test dependent                                                                                                                                          |
| SCH                                                                                                               | SCH_Ec/lor = -12 dB     | This power shall be divided equally<br>between Primary and Secondary<br>Synchronous channels                                                                                                                     |
| PICH                                                                                                              | PICH_Ec/lor = -15 dB    |                                                                                                                                                                                                                  |
| DPCH                                                                                                              | Test dependent power    | When S-CPICH is the phase reference in<br>a test condition, the phase of DPCH shall<br>be 180 degrees offset from the phase of<br>P-CPICH.<br>When BCH performance is tested the<br>DPCH is not transmitted.     |
| OCNS Necessary power so that total<br>transmit power spectral density of<br>Node B (lor) adds to one <sup>1</sup> |                         | OCNS interference consists of 16 dedicated data channels as specified in table C.6.                                                                                                                              |

Table C.3: Downlink Physical Channels transmitted during a connection<sup>1</sup>

NOTE 1 For dynamic power correction required to compensate for the presence of transient channels, e.g. control channels, a subset of the DPCH channels may be used.

### C.3.3 Connection with open-loop transmit diversity mode

Table C.4 is applicable for measurements for subclause 8.6.1 (Demodulation of DCH in open loop transmit diversity mode).

| Physical Channel    | Power ratio                                                                                            | NOTE                                                                                                                                                                                                                       |

 Table C.4: Downlink Physical Channels transmitted during a connection<sup>1</sup>

Note 1: For dynamic power correction required to compensate for the presence of transient channels, e.g. control channels, a subset of the DPCH channels may be used.

### C.3.4 Connection with closed loop transmit diversity mode

Table C.5 is applicable for measurements for subclause 8.6.2 (Demodulation of DCH in closed loop transmit diversity mode).

# C.5 HSDPA DL Physical channels

### C.5.1 Downlink Physical Channels connection set-up

Table C.8 is applicable for the measurements for tests in subclause 7.4.2, 9.2.1 and 9.3. Table C.9 is applicable for the measurements for tests in subclause 9.2.2 and 9.2.4. Table C.10 is applicable for the measurements for tests in subclause 9.2.3. Table C.11 is applicable for the measurements for tests in subclause 9.4.1. Table C.12 is applicable for the measurements in subclause 9.4.2. Table C.12A and C.12B are applicable to requirements in subclause 9.6. Table C.12D is applicable for the measurements in subclause 9.2.4 and 9.2.4A when explicitly mentioned. Table C.12E is applicable for the measurements in subclause 9.4.3 and 9.4.4 when explicitly mentioned. Table C.12F is applicable for the measurements in subclause 9.2.4E and 9.4.4 when explicitly mentioned. Table C.12F is applicable for the measurements in subclause 9.4.5 and 9.4.6.

# Table C.8: Downlink physical channels for HSDPA/DC-HSDPA/DB-DC-HSDPA/4C-HSDPA receiver testing for Single Link performance.

| Physical<br>Channel | Parameter       | Value                                                                                                       | Note                                                                                                                                                                                                                                            |

| Note 1:Transmit diversity (STTD or TSTD) is disabled on P-CCPCH, PICH and SCH.Note 2:OCNS is not present for this test. HS-PDSCH is used in order to model other UE MIMO traffic. |                 |                                                                                                          |                                                                                                   |  |

### C.5.2 OCNS Definition

The selected channelization codes and relative power levels for OCNS transmission during for HSDPA performance assessment for other than enhanced performance type 3i are defined in Table C.13. The selected codes are designed to have a single length-16 parent code. The test definition for the enhanced performance type 3i is defined in section C.5.3.

| Channelization<br>Code at SF=128 | Relative Level<br>setting (dB)<br>(Note 1) | DPCH Data                                                            |
|----------------------------------|--------------------------------------------|----------------------------------------------------------------------|
| 122                              | 0                                          | The DPCH data for each channelization code                           |
| 123                              | -2                                         | shall be uncorrelated with each other and with                       |
| 124                              | -2                                         | any wanted signal over the period of any                             |

| Channelization<br>Code at SF=128 | DPCH Data                                                                                                                                |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| 6                                | For OCNS with transmit diversity the DPCH data sent to each antenna shall be either STTD encoded or generated from uncorrelated sources. |

Note 1: The relative level setting specified in dB refers only to the relationship between the OCNS channels. The level of the OCNS channels relative to the Ior of the complete signal is a function of the power of the other channels in the signal with the intention that the power of the group of OCNS channels is used to make the total signal add up to 1.

### C.5.3 Test Definition for Enhanced Performance Type 3i

This section defines additional test definition for enhanced performance type 3i including: number of interfering cells and their respective powers; transmitted code and power characteristics (OCNS) for serving and interfering cells; and frame offsets for interfering cells. For DC-HSDPA, DB-DC-HSDPA and 4C-HSDPA requirements, the number of interfering cells and their respective powers; transmitted code and power characteristics (OCNS) for serving and interfering and interfering cells; and frame offsets for interfering cells shall be the same for each carrier frequency. The transmitted OCNS and data signals shall be independent for each cell.

DIPi =  $\hat{I}_{or(i+1)} / I_{oc}$  where  $\hat{I}_{orj}$  is the average received power spectral density from the *j*-th strongest interfering cell ( $\hat{I}_{orl}$  is assumed to be the power spectral density associated with the serving cell), and  $I_{oc}$ " is given

by  $I_{oc}' = \sum_{j=2}^{3} \hat{I}_{orj} + I_{oc}$  where loc is the average power spectral density of a band limited white noise source

consistent with the definition provided in section 3.2.

#### C.5.3.1 Transmitted code and power characteristics for serving cell

The downlink physical channel code allocations for the serving cell are specified in Table C.14. Ten HS-PDSCH codes have been reserved for the user of interest, based upon the use of QPSK with FRC H-Set 6. The other user codes are selected from 46 possible SF = 128 codes. Note not all 46 of these codes are used, and in addition only 16 codes are used at a given instance in time. Table C.15 summarizes the power allocations of different channels for the serving cell for 50% and 25% HS-PDSCH power allocation. Note the power allocations in the last row of Table C.15 are to be split between the HS-SCCH and the other users" channels in order to ensure proper operation of the HS-SCCH during testing.

Table C.16 summarizes the channelization codes to be used for the other users channels (OCNS) along with their respective relative power allocations in dB when HS-PDSCH is allocated 25% or 50% of the total power. As shown in Table C.16, there are two groups of 16 codes, which are randomly selected with equal probability on a symbol-by-symbol basis. This random selection is done per code pair, where a code pair occupies the same row, as opposed to selecting all of the codes within group 1 or group 2. This random selection between these two groups is for purposes of modelling a simplified form of DTX. Note that the switching time for the symbols with SF = 64 would be the symbol timing for SF = 128 channel. Thus, there would be two different symbol times dependent upon the SF. For SF = 64, symbol time ~ 16.67 microseconds, and for SF = 128, symbol time ~ 33.33 microseconds. Each of these users is also power controlled as described in section C.5.3.3.

The scrambling code of the serving cell is set to 0.

| Channelization<br>Code at SF=128 | Note                                |
|----------------------------------|-------------------------------------|
| 0                                | P-CPICH, P-CCPCH and PICH on SF=256 |
| 1                                |                                     |
| 27                               | 6 SF=128 codes free for OCNS        |
| 887                              | 10 HS-PDSCH codes at SF=16          |
| 88127                            | 40 SF=128 codes free for OCNS       |

| C <sub>ch,64,52</sub>   | C <sub>ch,64,44</sub>   | 0.0  |
| C <sub>ch,128,110</sub> | C <sub>ch,128,124</sub> | -4.6 |
| Cch,128,114             | C <sub>ch,128,115</sub> | -4.8 |
| C <sub>ch,128,116</sub> | C <sub>ch,128,126</sub> | -4.8 |
| C <sub>ch,64,60</sub>   | C <sub>ch,64,46</sub>   | -1.1 |
| C <sub>ch,128,125</sub> | C <sub>ch,128,95</sub>  | -4.1 |

Note: The relative level settings specified in dB refer only to the relationship between the OCNS channels. For the serving cell, the sum of the powers of the OCNS channels plus the power allocated to the HS-SCCH must add up to the values specified in the last row of Table C.15. For the interfering cells, the sum of the powers of the OCNS channels must add up to the value shown in the last row of Table C.17.

#### C.5.3.2 Transmitted code and power characteristics for interfering cells

The downlink physical channel code allocations for the interfering cells are same as for the serving cell as given in Table C.14. The modelling approach for the interfering cells is summarized in Table C.17. The modelling of the other users" dedicated channels is done in the same way as in the case of the serving cell except that the HSDPA power allocation is fixed at 50% and the total power allocated is not shared with the HS-SCCH. Thus, the two groups of channelization codes defined in Table C.16 apply, along with the specified relative power levels.

|                                               | Interfering cell(s)                 |
|-----------------------------------------------|-------------------------------------|
| Common channels                               | 0.195 (-7.1dB)                      |
|                                               | As specified in Table C.8           |
| HS-PDSCH transport                            | Selected randomly from Table C.18   |
| format                                        | Independent for each interferer.    |
| HS-PDSCH power                                | 0.5                                 |
| allocation [E <sub>c</sub> /I <sub>or</sub> ] | (-3 dB)                             |
| Other users" channels                         | 0.3049                              |
|                                               | (-5.16 dB)                          |
|                                               | Set according to Table C.16 for 50% |
|                                               | HS-PDSCH power allocation           |

 Table C.17. Summary of modelling approach for the interfering cells.

Note: The values given in decibel are only for information.

The HS-PDSCH transmission for interfering cells is modelled to have randomly varying modulation and number of codes. The predefined modulation and number of codes are given in Table C.18, with the actual codes selected per the code allocation given in Table C.14. The transmission from each interfering cell is randomly and independently selected every HSDPA TTI among the four options given in Table C.18.

The scrambling codes of the interfering cells are set to 16 and 32, respectively. The frame offsets for the interfering cells are set to 1296 and 2576 chips relative to the serving cell. The scrambling code value of 16 and the frame offset value of 2576 corresponds to the first interfering cell.

| # | Used modulation and number<br>of HS-PDSCH codes |
|---|-------------------------------------------------|
| 1 | QPSK with 5 codes                               |
| 2 | 16QAM with 5 codes                              |
| 3 | QPSK with 10 codes                              |
| 4 | 16QAM, with 10 codes                            |

 Table C.18. Predefined interferer transmission.

#### C.5.3.3 Model for power control sequence generation

In this section the modelling of power control for the other users" channels is described. There are two powers that are calculated for each user, I at each slot, n. The first is an interim power calculation, which develops a power  $P_n^i$  in dB.

The second is the actual applied transmit power,  $\hat{P}_n^i$  in the linear domain, which is normalized such that the total power for all users remains the same as that originally allocated. The interim power calculation is described first followed by the applied, normalized power calculation.

The interim power is varied randomly, either by increasing or decreasing it by 1 dB steps in each slot, i.e.

 $P_n^i = P_{n-1}^i + \Delta$ , where  $\Delta \in \{-1, +1\}$  (EQ.C.5.3.3.1)

The probability of  $\Delta$  having a value of +1 for the *i*<sup>th</sup> user at time instant *n* can be determined as

$$\Pr_{n}^{i}(\Delta = +1) = 0.5 - (P_{n-1}^{i} - P_{0}^{i})\frac{0.5}{L}$$
 (EQ.C.5.3.3.2)

where,  $P_{n-1}^{i}$  is the interim power at time instant *n*-1 and  $P_{0}^{i}$  is the initial value given in Table C.16 after conversion to dB for each of the two possible HS-PDSCH power allocations. *L* is a scaling factor which can be used to determine the range to which the variation of power is confined. The value of *L* is set to 10, leading to a variance of ~5 dB.

The applied, normalized power is given by

$$\hat{P}_{n}^{i} = \frac{P_{lin,n}^{i}}{\sum_{i} P_{lin,n}^{i}} \sum_{i} P_{lin,0}^{i}$$
(EQ.C.5.3.3.3)

where  $P_{lin,n}^{i}$  is the interim power of the user I at time instant n in the linear domain, and  $P_{lin,0}^{i}$  is the initial value of the

i<sup>th</sup> user"s power also in the linear domain. Each summation is over all 16 possible values for  $P_{lin,n}^i$  and  $P_{lin,0}^i$  where the latter summation is equal to either 0.5551 or 0.3049 for HS-PDSCH allocations of 25% and 50%, respectively, see Table C.16. The total instantaneous output power of the OCNS is now always equal to its allocated power. One other subtle point to note is that at each iteration of interim power generation using (EQ.C.5.3.3.1) that the value of  $P_{n-1}^i$  is set

to  $P_n^i$  of the previous iteration as opposed to  $\hat{P}_n^i$  of the previous iteration. In summary, two sets of power control sequences are developed using (EQ.C.5.3.3.1) and (EQ.C.5.3.3.3), respectively, where the interim outputs developed by (C.1) are used to develop the applied, normalized values described by (EQ.C.5.3.3.3) and to which the actual channel powers are set.

### C.5.4 Simplified Multi Carrier HSDPA testing method

For DC-HSDPA, DB-DC-HSDPA or 4C-HSDPA tests which require more than 8 independent faders, the resulting propagation channel(s) shall be generated by considering a number of independent faders needed for one carrier and connecting them to the signal of randomly chosen carrier(s). The maximum number of channel faders on the test will be less than or equal to 8. The remaining carrier(s) shall be connected without a channel fader but with AWGN. The throughput shall be collected only for the carrier(s) connected to channel faders.

The test shall be repeated by choosing carrier(s) excluding already chosen carrier(s) until all the carrier(s) are tested under fading conditions. The sum of all the collected throughputs from each carrier shall be compared against the reference value in the requirements.

All supported carriers shall be configured and activated during the test.

### C.5.4A Simplified Multiflow HSDPA testing method

For Multiflow HSDPA tests which require more than 8 independent faders, the resulting propagation channel(s) shall be generated by considering a number of independent faders needed for one carrier frequency and connecting them to the signal of randomly chosen carrier(s). The maximum number of channel faders on the test will be less than or equal to 8. The remaining carrier(s) shall be connected without a channel fader but with AWGN. The throughput shall be collected only for the carrier(s) connected to channel faders.

The test shall be repeated by choosing carrier(s) excluding already chosen carrier(s) until all the carrier(s) are tested under fading conditions.

All supported carriers shall be configured and activated during the test.

### C.5.5 Test Definition for Multiflow HSDPA

This section defines additional test configuration for Multiflow HSDPA including: number of cells and their respective powers; transmitted code and power characteristics (OCNS) for the interfering cell; and frame offsets for assisting serving HS-DSCH cell and interfering cell.

#### C.5.5.1 Test configuration when 2 cells are configured in Multiflow mode

The relative powers for the serving HS-DSCH cell (Cell 1), the assisting serving HS-DSCH cell (Cell 2) and additional interfering cell (Cell 3, if present) are shown in Table C.19. The scrambling code of the serving HS-DSCH cell is set to 0, that of the assisting serving HS-DSCH cell is set to 16, and that of the interfering cell is set to 32. The frame offsets of the assisting serving HS-DSCH cell is set to 2560 chips and that of the interfering cell is set to 1296 chips relative to the serving HS-DSCH cell. The downlink physical channel setup for the serving HS-DSCH cell and assisting serving HS-DSCH cell is shown in Table C.20 and Table C.21 respectively. The downlink physical channel setup for the additional interfering cell is shown in Table C.22.

| Number of additional<br>interfering cell                                                                                                                                               | Î <sub>or1</sub> /I <sub>oc</sub> | Î <sub>or2</sub> /I <sub>oc</sub> | Î <sub>or3</sub> /I <sub>oc</sub> | Cell 1<br>Geometry | Cell 2<br>Geometry |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|--------------------|--------------------|
| 0                                                                                                                                                                                      | 7.01                              | 3.61                              | -inf                              | 1.83               | -4.19              |
| 1                                                                                                                                                                                      | 5.27                              | 2.52                              | -2.37                             | 0.00               | -4.42              |
| Notes: 1) Cell 1 corresponds to the serving HS-DSCH cell, Cell 2 corresponds to the assisting serving HS-DSCH cell, and Cell 3 is the additional interfering cell.                     |                                   |                                   |                                   |                    |                    |
| <ol> <li>Cell 1 Geometry is defind by Î<sub>or1</sub>/I<sub>oc,1</sub>", where I<sub>oc,1</sub>"=(I<sub>oc</sub>+ Î<sub>or2</sub>+ Î<sub>or3</sub>).</li> </ol>                        |                                   |                                   |                                   |                    |                    |
| 3) Cell 2 Geometry is defind by $\hat{\mathbf{l}}_{or2}/\mathbf{l}_{oc,2}$ ", where $\mathbf{l}_{oc,2}$ "=( $\mathbf{l}_{oc}$ + $\hat{\mathbf{l}}_{or1}$ + $\hat{\mathbf{l}}_{or3}$ ). |                                   |                                   |                                   |                    |                    |

 Table C.19: Relative power of the cells in Multiflow HSDPA test

# Table C.20: Downlink physical channels for the serving/secondary serving HS-DSCH cell in HSDPA receiver testing of Multiflow HSDPA

| Physical<br>Channel | Parameter      | Value | Note                                                                                     |
|---------------------|----------------|-------|------------------------------------------------------------------------------------------|
| P-CPICH             | P-CPICH_Ec/lor | -10dB |                                                                                          |
| P-CCPCH             | P-CCPCH_Ec/lor | -12dB | Mean power level is shared with SCH.                                                     |
| SCH                 | SCH_Ec/lor     | -12dB | Mean power level is shared with P-CCPCH –<br>SCH includes P- and S-SCH, with power split |

|           |                 |                                                                                                                                                           | between both.                                                                                    |
|-----------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| PICH      | PICH_Ec/lor     | -15dB                                                                                                                                                     |                                                                                                  |
| DPCH      | DPCH_Ec/lor     | Necessary power so that<br>total transmit power spectral<br>density of Node B (lor) adds<br>to one<br>Only for serving HS-DSCH<br>cell, omitted otherwise | 12.2 kbps DL reference measurement channel as defined in Annex A.3.1                             |
| HS-SCCH-1 | HS-SCCH_Ec/lor  | -8 dB for serving HS-DSCH<br>cell, otherwise necessary<br>power so that total transmit<br>power spectral density of<br>Node B (Ior) adds to one           |                                                                                                  |
| HS-SCCH-2 | HS-SCCH_Ec/lor  | DTX"d                                                                                                                                                     | No signalling scheduled, or power radiated, on this HS-SCCH, but signalled to the UE as present. |
| HS-SCCH-3 | HS-SCCH_Ec/lor  | DTX"d                                                                                                                                                     | As HS-SCCH-2.                                                                                    |

#### Table C.22: Downlink physical channels for the additional interfering cell in Multiflow HSDPA testing

|                 | Interfering cell   |
|-----------------|--------------------|
| Common channels | 0.195 (-7.1dB)     |
| Common channels | Same as Table C.20 |

| HS-SCCH_Ec/lor                                                  | -12 dB                                                                                    |
|-----------------------------------------------------------------|-------------------------------------------------------------------------------------------|
| HS-PDSCH transport format                                       | Selected randomly from Table C.18                                                         |
| HS-PDSCH power allocation<br>[E <sub>c</sub> /I <sub>or</sub> ] | Necessary power so that total transmit power spectral density of Node B (lor) adds to one |

#### C.5.5.2 Test configuration when 3 cells are configured in Multiflow mode

When 3 cells are configured in Multiflow mode, the test configuration in C.5.5.1 shall be duplicated for each frequency according to Table C.20 and Table C.21. The downlink physical channel setup for the serving HS-DSCH cell, assisting serving HS-DSCH cell and the secondary serving HS-DSCH cell is shown in Table C.23. Cell 2 on the carrier of the secondary serving HS-DSCH cell becomes an interfering cell and does not participate in Multiflow mode. The downlink physical channel setup of Cell 2 on the carrier of the secondary serving HS-DSCH cell shall follow Table C.21.

| Table C.23: Test configuration when 3 | 3 cells are configured in Multiflow mode |
|---------------------------------------|------------------------------------------|
|---------------------------------------|------------------------------------------|

|                                | Setting                 |
|--------------------------------|-------------------------|
| Serving HS-DSCH cell           | According to Table C.20 |
| Assisting serving HS-DSCH cell | According to Table C.21 |
| Secondary serving HS-DSCH cell | According to Table C.20 |

#### C.5.5.3 Test configuration when 4 cells are configured in Multiflow mode

When 4 cells are configured in Multiflow mode, the test configuration in C.5.5.1 shall be duplicated for each frequency according to Table C.20 and Table C.21. The downlink physical channel setup for the serving HS-DSCH cell, assisting serving HS-DSCH cell, the secondary serving HS-DSCH cell and the assisting secondary serving HS-DSCH cell is shown in Table C.24.

Table C.24: Test configuration when 3 cells are configured in Multiflow mode

|                                          | Setting                 |
|------------------------------------------|-------------------------|
| Serving HS-DSCH cell                     | According to Table C.20 |
| Assisting serving HS-DSCH cell           | According to Table C.21 |
| Secondary serving HS-DSCH cell           | According to Table C.20 |
| Assisting secondary serving HS-DSCH cell | According to Table C.21 |

# C.6 MBMS DL Physical channels

# C.6.1 Downlink Physical Channels connection set-up

Table C.14 is applicable for measurements on the Performance requirements in Clause 11.

#### Table C.14: Downlink Physical Channels on each radiolink

| Physical Channel | Power ratio                                                                                     | NOTE                                                                                         |
|------------------|-------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| P-CPICH          | P-CPICH_Ec/lor = -10 dB                                                                         | Only P-CPICH is used as phase<br>reference for S-CCPCH carrying MCCH<br>or MTCH.             |
| P-CCPCH          | P-CCPCH_Ec/lor = -12 dB                                                                         |                                                                                              |
| SCH              | SCH_Ec/lor = -12 dB                                                                             | This power shall be divided equally<br>between Primary and Secondary<br>Synchronous channels |
| PICH             | PICH_Ec/lor = -15 dB                                                                            |                                                                                              |
| S-CCPCH          | S-CCPCH_Ec/lor = test dependent                                                                 |                                                                                              |
| DPCH             | TBD                                                                                             | DPCH is enable only when UE has<br>capability to receive MBMS in<br>CELL_DCH state           |
| OCNS             | Necessary power so that total<br>transmit power spectral density of<br>Node B (lor) adds to one | OCNS interference consists of 16 dedicated data channels as specified in table C.6.          |

## C.6.2 Downlink Physical Channels connection set-up for MBSFN

#### Table C.14a: Downlink Physical Channels for performance requirements

| Physical Channel | Power ratio                                                                                     | NOTE                                                                                         |
|------------------|-------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| P-CPICH          | P-CPICH_Ec/lor = -10 dB                                                                         | Only P-CPICH is used as phase<br>reference for S-CCPCH carrying MCCH<br>or MTCH.             |
| P-CCPCH          | P-CCPCH_Ec/lor = -12 dB                                                                         |                                                                                              |

| OCNS             | Necessary power so that total<br>transmit power spectral density of<br>Node B (lor) adds to one | Same code channels as used for DPCH, see table C.6                                           |

# Annex D (normative) : Environmental conditions

# D.1 General

This normative annex specifies the environmental requirements of the UE. Within these limits the requirements of the present documents shall be fulfilled.

# D.2 Environmental requirements

The requirements in this clause apply to all types of UE(s).

### D.2.1 Temperature

The UE shall fulfil all the requirements in the full temperature range of:

| Table D.1 |
|-----------|
|-----------|

| +15°C to +35°C                     | for normal conditions (with relative humidity of 25 % to 75 %)  |
|------------------------------------|-----------------------------------------------------------------|
| $-10^{\circ}$ C to $+55^{\circ}$ C | for extreme conditions (see IEC publications 68-2-1 and 68-2-2) |

Outside this temperature range the UE, if powered on, shall not make ineffective use of the radio frequency spectrum. In no case shall the UE exceed the transmitted levels as defined in TS 25.101 for extreme operation.

### D.2.2 Voltage

The UE shall fulfil all the requirements in the full voltage range, i.e. the voltage range between the extreme voltages.

The manufacturer shall declare the lower and higher extreme voltages and the approximate shutdown voltage. For the equipment that can be operated from one or more of the power sources listed below, the lower extreme voltage shall not be higher, and the higher extreme voltage shall not be lower than that specified below.

| Power source                | Lower extreme<br>voltage | Higher extreme<br>voltage | Normal conditions voltage |  |  |
|-----------------------------|--------------------------|---------------------------|---------------------------|--|--|
| AC mains                    | 0,9 * nominal            | 1,1 * nominal             | nominal                   |  |  |
| Regulated lead acid battery | 0,9 * nominal            | 1,3 * nominal             | 1,1 * nominal             |  |  |
| Non regulated batteries:    |                          |                           |                           |  |  |
| Leclanché                   | 0,85 * nominal           | Nominal                   | Nominal                   |  |  |
| Lithium                     | 0.95 * nominal           | 1,1 * nominal             | 1,1 * nominal             |  |  |
| Mercury/nickel & cadmium    | 0,90 * nominal           | Nominal                   | Nominal                   |  |  |

#### Table D.2

Outside this voltage range the UE if powered on, shall not make ineffective use of the radio frequency spectrum. In no case shall the UE exceed the transmitted levels as defined in TS 25.101 for extreme operation. In particular, the UE shall inhibit all RF transmissions when the power supply voltage is below the manufacturer declared shutdown voltage.

### D.2.3 Vibration

The UE shall fulfil all the requirements when vibrated at the following frequency/amplitudes.

| Frequency       | ASD (Acceleration Spectral Density) random vibration                  |
|-----------------|-----------------------------------------------------------------------|
| 5 Hz to 20 Hz   | 0,96 m <sup>2</sup> /s <sup>3</sup>                                   |
| 20 Hz to 500 Hz | 0,96 m <sup>2</sup> /s <sup>3</sup> at 20 Hz, thereafter -3 dB/Octave |

#### Table D.3

Outside the specified frequency range the UE, if powered on, shall not make ineffective use of the radio frequency spectrum. In no case shall the UE exceed the transmitted levels as defined in TS 25.101 for extreme operation

# Annex E (informative): UARFCN numbers

# E.1 General

This Annex lists the UARFCN numbers used for the frequency bands implemented in the current specification.

# E.2 List of UARFCN used for UTRA FDD bands

The UARFCN numbering scheme detailed in clauses 5.4.3 and 5.4.4 of this specification is summarized for information in Table E.1. The table shows the UARFCN assigned to all UTRA FDD operating bands, starting with the lowest UARFCN and continuing up to the highest one assigned.

Each band may have two table entries, one for the 'general' numbers and one for the 'additional' ones, as specified in Table 5.2. The entries in Table E.1 are explained as follows:

Band range: The size of the frequency range for the UTRA FDD band specified in Table 5.0.

**Range res.:** The size of the frequency range corresponding to the UARFCN range that has been 'reserved' in 3GPP for possible future extensions of the band.

**Formula offset:** The offset parameter ( $F_{UL_Offset}$  or  $F_{DL_Offset}$ ) in the formula, used to calculate the UARFCN as specified in Clause 5.4.3.

Assigned/reserved: Indicates the significance of the UARFCN and corresponding frequencies listed as follows:

Start res. Start of the UARFCN range reserved for the band.

- Min. The lowest UARFCN assigned to the band.
- Max. The highest UARFCN assigned to the band.

**End res.** End of the UARFCN range reserved for the band.

N<sub>U</sub>, N<sub>D</sub>: Uplink and downlink UARFCN.

F<sub>UL</sub>, F<sub>DL</sub>: Corresponding uplink and downlink frequencies.

(Add.): Refers to the additional UARFCN (on the 100 kHz raster) as specified in Table 5.1A.

Note that bands V and VI are shown with common entries in Table E.1, since their UARFCN ranges are completely overlapping.

|                     |                        |                        |                                                      | Uplink UAF             | RFCN                |                          |                                                      | Downlink U             | ARFCN               |                          |
