Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://webapp.etsi.org/IPR/home.asp).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under www.etsi.org/key.

Foreword

This Technical Specification (TS) has been produced by the 3rd Generation Partnership Project (3GPP).

The present document is part the 32.300-series covering the 3rd Generation Partnership Project: Technical Specification Group Services and System Aspects; Telecommunication Management; Notification Management, as identified below:

- 32.301: "Notification Integration Reference Point: Requirements";
- 32.302: "Notification Integration Reference Point: Information Service Version 2";
- 32.303: "Notification Integration Reference Point: CORBA Solution Set Version 2:1";
- 32.304: "Notification Integration Reference Point: CMIP Solution Set Version 2:1";

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
 - 1 presented to TSG for information;
 - 2 presented to TSG for approval;
 - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

Introduction

Configuration Management (CM), in general, provides the operator with the ability to assure correct and effective operation of the 3G network as it evolves. CM actions have the objective to control and monitor the actual configuration on the Network Elements (NEs) and Network Resources (NRs), and they may be initiated by the operator or by functions in the Operations Systems (OSs) or NEs.

CM actions may be requested as part of an implementation programme (e.g. additions and deletions), as part of an optimisation programme (e.g. modifications), and to maintain the overall Quality Of Service (QOS). The CM actions are initiated either as a single action on a NE of the 3G network or as part of a complex procedure involving actions on many NEs.

The Itf-N interface is built up by a number of Integration Reference Points (IRPs) and a related Name Convention, which realise the functional capabilities over this interface. The basic structure of the IRPs is defined in 3GPP TS 32.101 [5] and 3GPP TS 32.102 [6].

Network Elements (NEs) under management and element managers generate notifications of events about occurrences within the network. Different kinds of events carry different kinds of information. For instance a new alarm as specified in Alarm IRP: Information Service [1], is one possible kind of event, an object creation as specified in Basic CM IRP: Information Service [8] is another possible kind of event.

Information of an event is carried in notification. An IRPAgent (typically an EM or a NE) emits notifications. IRPManager (typically a network management system) receives notifications. The purpose of Notification IRP is to define an interface through which an IRPManager can subscribe to IRPAgent for receiving notifications.

This IRP bases its design on work captured in ITU-T Recommendation X.734 [2], OMG Notification Service [4]. The central design ideas are:

• Separation of notification Consumers (IRPManagers) from Producers (IRPAgents);

Notifications are sent to IRPManagers without the need for IRPManagers to periodically check for new notifications.

Common characteristics related to notifications in all other IRPs are gathered in one IRP.

1 Scope

The present document specifies the Common Object Request Broker Architecture (CORBA) Solution Set (SS) for the IRP whose semantics is specified in Notification IRP: Information Service [5].

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

3 Definitions and abbreviations

3.1 Definitions

For the purposes of the present document, the following terms and definitions apply. Please refer to 3GPP TS 32.10 [7], 3GPP TS 32.102 [8] and 3GPP TS 32.301 [9].

IRP document version number string (or "IRPVersion"). See 3GPP TS 32.311 [11].

3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply:

CM Configuration Management

CORBA Common Object Request Broker Architecture (OMG)

EC	Event channel (OMG)
IDL	Interface Definition Language (OMG)
IS	Information Service
IOR	Interoperable Object Reference
NC	Notification Channel (OMG)
NE	Network Element
NV	Name and Value pair
EM	Element Manager
OMG	Object Management Group
QoS	Quality of Service
SS	Solution Set
UML	Unified Modelling Language (OMG)

4 Architectural features

The overall architectural feature of Notification IRP is specified in 3GPP TS 32.302 [5]. This clause specifies features that are specific to the CORBA Solution Set (SS).

4.1 Notification services

In the CORBA Solution Set, notifications are emitted by IRPAgent using CORBA Notification service (OMG TC Document telecom [2]).

CORBA Event service (OMG CORBA services [3]) provides event routing and distribution capabilities. CORBA Notification service provides, in addition to Event service, event filtering and support for Quality of Service (QoS) as well.

A subset of CORBA Notification services shall be used to support the implementation of notification. This CORBA Notification service subset, in terms of OMG Notification service (OMG TC Document telecom [2]) defined methods, is identified in the present.

4.1.1 Support of Push and Pull Interface

The IRPAgent shall support the OMG Notification push interface model. Additionally, it may support the OMG Notification pull interface model as well.

4.1.2 Support of multiple notifications in one push operation

For efficiency, IRPAgent uses the following OMG Notification Service (OMG TC Document telecom [2]) defined interface to pack multiple notifications and push them to IRPManager using one method push_structured_events. The method takes as input a parameter of type EventBatch as defined in the OMG CosNotification module (OMG TC Document telecom [2]). This data type is a sequence of Structured Events (see clause 4). Upon invocation, this parameter will contain a sequence of Structured Events being delivered to IRPManager by IRPAgent to which it is connected.

The maximum number of events that will be transmitted within a single invocation of this operation is controlled by IRPAgent wide configuration parameter. The amount of time IRPAgent will accumulate individual events into the sequence before invoking this operation is controlled by IRPAgent wide configuration parameter as well.

IRPAgent may push EventBatch with only one Structured Event.

The OMG Notification service (OMG TC Document telecom [2]) defined IDL module is shown below.

```
module CosNotifyComm {
...
Interface SequencePushConsumer : NotifyPublish {
```

5 Mapping

5.1 Operation mapping

Notification IRP: IS (3GPP TS 32.302 [5]) defines semantics of operations visible across this IRP. These operations are the operations of the IOCs defined in [5].

Table 1 maps the operations defined in Notification IRP: IS (3GPP TS 32.302 [5]) to their equivalents (methods) in this Solution Set (SS). Specifically, the table 1 maps the operations of the IOCs defined in [5] to their equivalents in this SS. Since one of the IOCs, the NotificationIRP IOC, inherits from the ManagedGenericIRP IOC [4], the table 1 also maps the operations of ManagedGenericIRP IOC to their equivalents (methods) in this SS.

The table 1 also qualifies if a method is Mandatory (M) or Optional (O)

Table 1: Mapping from IS Operation to SS Equivalents

IS Operations in 3GPP TS 32.302 [5]	SS Methods	Qualifier
subscribe	attach_push, attach_push_b, attach_pull	M, O, O
unsubscribe	detach	M
getIRPVersion (see note.)	get_notification_IRP_version	M
getSubscriptionStatus	get_subscription_status	0
getSubscriptionIds	get_subscription_ids	0
changeSubscriptionFilter	If subscription is established using attach_push method, the SS equivalent shall be change_subscription_filter. The IDL specification of this method is included in Annex A. This method is Optional (O).	
	If subscription is established using attach_push_b method, the SS equivalent shall be modify_constraints. The method is defined in OMG Notification Service Filter Interface (OMG TC Document telecom [2]). The IDL specification of this method is not included in Annex A. If IRPAgent supports the optional attach_push_b method, it shall support this method as mandatory.	
	If subscription is established using attach_pull method, the SS equivalent shall be modify_constraints. The method is defined by OMG Notification Service Filter Interface (OMG TC Document telecom [2]). The IDL specification of this method is not included in Annex A. If IRPAgent supports the optional attach_pull method, it shall support this method as mandatory.	
suspendSubscription	If subscription is established using attach_push, there is no SS equivalent. In other words, IRPManager cannot suspend subscription.	See box on the left
	If subscription is established using attach_push_b, the SS equivalent shall be suspend_connection. This method is defined by OMG Notification Service (OMG TC Document telecom [2]). The IDL specification of this method is not included in Annex A. If IRPAgent supports the optional attach_push_b method, it shall support this method as mandatory.	
	If subscription is established using attach_pull, there is no SS equivalent.	
resumeSubscription	If subscription is established using attach_push, there is no SS equivalent. In other words, IRPManager cannot resume subscription.	See box on the left
	If subscription is established using attach_push_b, the SS equivalent shall be resume_connection. This method is defined by OMG Notification Service (OMG TC Document telecom [2]). The IDL specification of this method is not included in Annex A. If IRPAgent supports the optional attach_push_b method, it shall support this method as mandatory.	
	If subscription is established using attach_pull, there is no SS equivalent.	
getNotificationCategories	get_notification_categories	0
getOperationProfile (see note.)	get_notification_IRP_operation_profile	0
getNotificationProfile (see note.)	get_notification_IRP_notification_profile	0
NOTE: These 3 operation inherits from it.	s are operations of ManagedGenericIRP IOC specified in [4]. The Notification	IRP IOC of [5]

5.2 Operation parameter mapping

3GPP TS 32.302 [5] defines semantics of parameters carried in operations across the Notification IRP. Table 2 through table 14 indicate the mapping of these parameters, as per operation, to their equivalents defined in this SS.

Table 2: Mapping from IS subscribe parameters to SS attach_push equivalents

IS Operation parameter	SS Method parameter	Qualifier
managerReference	string manager_reference (see NOTE 1)	M
timeTick	long time_tick	0
notification Categories	NotificationIRPConstDefs::NotificationCategorySet notification_category_set	0
filter	string filter (see NOTE 2)	0
subscriptionId	Return value of type NotificationIRPConstDefs::SubscriptionId	M
status	Attach, ParameterNotSupported, InvalidParameter, AlreadySubscribed,	M
	AtLeastOneNotificationCategoryNotSupported	

- NOTE 1: IRPManager creates a CosNotifyComm::SequencePushConsumer object and invokes CORBA::ORB::object_to_string to obtain the stringified IOR, say s1. IRPManager stores the s1. IRPManager sends s1 as input parameter of attach_push to IRPAgent. IRPAgent receives s1, performs CORBA::ORB::string_to_object to obtain the IRPManager's IOR and uses it for its future methods. IRPAgent also stores the s1 for future comparisons. IRPManager later calls detach with s1. IRPAgent receives the stringified IOR s1, compares it with those stored stringified IORs (e.g., s1), finds a match, and performs the detach process. IRPAgent pushes sequence of Structured Events towards IRPManager via the CosNotifyComm::SequencePushConsumer object push_structured_events method, depending on the supplied notification categories and filter.
- NOTE 2: The grammar of the filter string is extended_TCL defined by OMG Notification Service (OMG TC Document telecom [2]). This SS and the Alarm IRP: CORBA SS [10] shall use this grammar only..

Table 3: Mapping from IS subscribe parameters to SS attach push b equivalents

IS Operation parameter	SS Method parameter	Qualifier
managerReference	string manager_reference (see NOTE 1)	M
timeTick	long time_tick	0
notification Categories	NotificationIRPConstDefs::NotificationCategorySet notification_category_set	0
filter	string filter (see NOTE 2)	0
subscriptionId	Return value of type NotificationIRPConstDefs::SubscriptionId	M
Not specified in IS	CosNotifyChannelAdmin::SequenceProxyPushSupplier system_reference (see NOTE 3)	М
status	Attach, OperationNotSupported, ParameterNotSupported, InvalidParameter, AlreadySubscribed, AtLeastOneNotificationCategoryNotSupported	М

- NOTE 1: IRPManager creates a CosNotifyComm::SequencePushConsumer object and invokes CORBA::ORB::object_to_string to obtain the stringified IOR, say s1. IRPManager stores the s1. IRPManager sends s1 as input parameter of attach_push_b to IRPAgent. IRPAgent receives s1 and stores the s1 for future comparisons. IRPManager later calls detach with s1. IRPAgent receives the stringified IOR s1, compares it with those stored stringified IORs (e.g., s1), finds a match, and performs the detach process.
- NOTE 2: The grammar of the filter string is extended_TCL defined by OMG Notification Service (OMG TC Document telecom [2]). This SS and the Alarm IRP: CORBA SS [10] shall use this grammar only.
- NOTE 3: IRPAgent provides this reference to which IRPManager can invoke methods to manage the subscription. Valid methods are not defined in this IRP. OMG CORBA Notification Service defines these methods. Read interface CosNotifyChannelAdmin::SequenceProxyPushSupplier and CosNotifyComm::SequencePushConsumer. IRPManager is expected to invoke connect_sequence_push_consumer method of this interface to connect its own cosNotifyComm::SequencePushConsummer with this reference. After successful connection, IRPAgent pushes sequence of Structured Events towards IRPManager.

Table 4: Mapping from IS subscribe parameters to SS attach pull equivalents

IS Operation parameter	SS Method parameter	Qualifier
managerReference	string manager_reference (see NOTE 1)	M
timeTick	long time_tick	0
notification Categories	NotificationIRPConstDefs::NotificationCategorySet notification_category_set	0
filter	string filter (see NOTE 2)	0
subscriptionId	Return value of type NotificationIRPConstDefs::SubscriptionId	M
Not specified in IS.	CosNotifyChannelAdmin::SequenceProxyPullSupplier system_reference (see NOTE 3)	M
status	Attach, OperationNotSupported, ParameterNotSupported, InvalidParameter, AlreadySubscribed, AtLeastOneNotificationCategoryNotSupported	M

- NOTE 1: IRPManager creates a CosNotifyComm::SequencePullConsumer object and invokes CORBA::ORB::object_to_string to obtain the stringified IOR, say s1. IRPManager stores the s1. IRPManager sends s1 as input parameter of attach_pull to IRPAgent. IRPAgent receives s1 and stores the s1 for future comparisons. IRPManager later calls detach with s1. IRPAgent receives the stringified IOR s1, compares it with those stored stringified IORs (e.g., s1), finds a match, and performs the detach process.
- NOTE 2: The grammar of the filter string is extended_TCL defined by OMG Notification Service (OMG TC Document telecom [2]). This SS and the Alarm IRP: CORBA SS [10] shall use this grammar only.
- NOTE 3: IRPAgent provides this reference to which IRPManager can invoke methods to manage the subscription. Valid methods are not defined in this IRP. OMG CORBA Notification Service defines these methods. Read interface CosNotifyChannelAdmin::SequenceProxyPullSupplier and CosNotifyComm::SequencePullConsumer. IRPManager is expected to invoke connect_sequence_pull_consumer method of this interface to connect its own CosNotifyComm::SequencePullConsummer with this reference. After successful connection, IRPManager pulls sequence of Structured Events from IRPAgent.

Table 5: Mapping from IS unsubscribe parameters to SS equivalents

IS Operation parameter	SS Method parameter	Qualifier
managerReference	string manager_reference	M
subscriptionId	NotificationIRPConstDefs::SubscriptionId subscription_id	0
status	Detach,InvalidParameter	M

notificationNameProfile,no	Return value of type ManagedGenericIRPConstDefs::MethodList	M
tificationParameterProfile		
status	GetNotificationIRPNotificationProfile,OperationNotSupported,InvalidParameter	M

5.3 Parameter mapping

Notification IRP: IS (3GPP TS 32.302 [5]) defines the semantics of common attributes carried in notifications. This SS does not provide the mapping of these attributes to their CORBA SS equivalents. Other IRPs such as Alarm IRP: IS (3GPP TS 32.111-2 [6]) identify and qualify these common attributes for use in their environment. Their corresponding SS documents define the mapping of these attributes to their SS equivalents.

6 IRPAgent's Behaviour

This clause describes some IRPAgent's behaviour not captured by IDL.

6.1 Subscription

IRPManager can invoke multiple attach_push, multiple attach_push_b or multiple attach_pull using different manager_reference(s). As far as IRPAgent is concerned, the IRPAgent will emit notifications to multiple "places" with their independent filter requirements. IRPAgent will not know if the notifications are going to the same IRPManager.

If IRPManager invokes multiple attach_push, attach_push_b or attach_pull using the same manager_reference and with an already subscribed notification_category, IRPAgent shall raise AlreadySubscribed exception to all invocations except one.

IRPManager can invoke multiple attach_push using the same manager_reference and with one or more not-yet-subscribed notification_categories. In this case, if IRPAgent supports all the notification categories requested, IRPAgent shall accept the invocation; otherwise, it raises

AtLeastOneNotificationCategoryNotSupported exception. IRPAgent shall have similar behaviour for attach_push_b and attach_pull.

When IRPManager is in subscription by invoking attach_push, IRPManager can change the filter constraint, using change_subscription_filter, applicable to the notification categories specified in the attach_push.

When IRPManager is in subscription by invoking attach_push_b, IRPManager can change the filter constraint during subscription using the OMG defined Notification Service Filter Interface. IRPManager shall not use change_subscription_filter; otherwise it shall get an exception.

6.2 IRPAgent supports multiple categories of Notifications

IRPAgent may emit multiple categories of Notifications. IRPAgent may have mechanism for IRPManager to pull for notifications of multiple categories.

IRPManager can query IRPAgent about the categories of notifications supported by using get_notification_categories.

IRPManager uses a parameter, notification_categories, in attach_push, attach_push_b and attach_pull to specify one or more categories of notifications wanted.

IRPManager uses a zero-length sequence in notification_categories of attach_push, attach_push_b and attach_pull to specify that all IRPAgent supported categories of notifications are wanted. If IRPManager uses attach_push with zero-length sequence in notification_categories and if the operation is successful, IRPAgent shall reject subsequent attach_push operation, regardless if the notification_categories contains a zero-length sequence or one or more specific notification categories. IRPAgent shall have similar behaviour for attach_push_b and attach_pull.

6.3 IRPAgent's integrity risk of attach_push_b Method

In the case that IRPAgent implements this method by extending or using OMG compliant Notification Service, the following IRPManager behaviour illustrates a risk to IRPAgent's integrity.

Given the object reference (IOR) of the SequenceProxyPushSupplier (as the mandatory output parameter of the subject method), IRPManager can invoke SequenceProxyPushSupplier.MyAdmin method.

IRPManager can then obtain the consumer admin object of the proxy. Then IRPManager can invoke ConsumerAdmin.MyChannel to get the IOR of the Notification Channel. IRPManager then can call EventChannel.MyFactory which will provide IRPManager the IOR of the EventChannelFactory itself. IRPManager can then able to invoke methods directly on the EventChannelFactory, like get_all_channels which lists all channel numbers and create_channel which allows IRPManager to create any number of additional channels.

A malicious IRPManager can, given access to the EventChannelFactory, get a list of existing channels and start connecting them together at random thus compromising the IRPAgent's integrity. Deployment of this attach_push_b needs strong authentication and authorisation mechanism in place.

The attach_push is mandatory. IRPAgent compliant to this IRP shall support it.

The attach_push_b is optional. It is recommended that IRPAgent concerned with integrity risk should not support the attach_push_b option.

6.4 Quality of Service Parameters

The OMG Notification Service [2] supports a variety of Quality of Service (QoS) properties, such as reliability and priority, that may be expressed to indicate the delivery characteristics of notifications. The following OMG Notification Service QoS parameter settings shall be required when the IRPAgent uses the OMG Notification Service to support this SS:

- 1. The order policy shall be set to FifoOrder (First-in, First-out) [2].
- 2. The message priority shall be set to 0, i.e., no priority [2].
- 3. The Start Time Supported shall be set to false, i.e., do not use Start Time [2].

The Stop Time Supported shall be set to false, i.e., do not use Stop Time [2].

When the OMG Notification Service is not used, the IRPAgent shall provide First-in, First-out notification ordering, not provide message priority and not provide the support of Start Time and Stop Time.

Annex A (normative): IDL Specification (file name "ManagedGenericIRPConstDefs.idl")

  typedef sequence <ParameterName> ParameterList;
  The Method defines the structure to be returned as part of
  get_supported_operations_profile(). The name shall be the actual method
  name (ex. "attach_push", "change_subscription_filter", etc.)
  The parameter_list contains a list of strings. Each string shall be
  the actual parameter name (ex. "manager_reference", "filter", etc.)
  struct Method
     MethodName name;
     ParameterList parameter_list;
  List of all methods and their associated parameters.
  typedef sequence <Method> MethodList;

/* ## Module: ManagedGenericIRPSystem
This module contains definitions commonly used among all IRPs such as Alarm IRP.
______
```

```
* /
module ManagedGenericIRPSystem
{
  Exception thrown when an unsupported optional parameter
   is passed with information.
  The parameter shall be the actual unsupported parameter name.
   exception ParameterNotSupported { string parameter; };
  Exception thrown when an invalid parameter value is passed.
  The parameter shall be the actual parameter name.
  exception InvalidParameter { string parameter; };
  Exception thrown when a valid but unsupported parameter value is passed.
   The parameter shall be the actual parameter name.
   exception ValueNotSupported { string parameter; };
  Exception thrown when an unsupported optional method is called.
   exception OperationNotSupported {};
};
#endif

#include "ManagedGenericIRPConstDefs.idl"
// This statement must appear after all include statements
#pragma prefix "3gppsa5.org"
/* ## Module: NotificationIRPConstDefs
This module contains definitions specific for Notification IRP.
______
module NotificationIRPConstDefs
  Define the current Notification IRP version.
  This string is used for the return value of
  get_Notification_IRP_versions().
   It should be updated based on the rule of sub-clause
  titled "IRP document version number string".
  const string NOTIFICATION_IRP_VERSION = "<to be updated using the rule>";
  Define the parameters (in the notification header) specified in
   the Notification IRP: IS.
   interface AttributeNameValue
   {
     const string NOTIFICATION_ID = "a";
     const string EVENT_TIME = "b";
     const string SYSTEM_DN = "c";
     const string MANAGED_OBJECT_CLASS = "d";
     const string MANAGED_OBJECT_INSTANCE = "e";
   };
   It defines the notification categories.
   A notification category is identified by the IRP name and its version number.
   typedef ManagedGenericIRPConstDefs::VersionNumberSet NotificationCategorySet;
```

```
It defines the notification types of a particular notification category.
   typedef sequence <string> NotificationTypePerNotificationCategory;
  This sequence identifies all notification types of all notification
   categories identified by NotificationCategorySet. The number of elements
   in this sequence shall be identical to that of NotificationCategorySet.
   typedef sequence <NotificationTypePerNotificationCategory>
      NotificationTypesSet;
   It defines a sequence of SubscriptionIds.
   typedef string SubscriptionId;
   typedef sequence <SubscriptionId> SubscriptionIdSet;
  This indicates if the subscription is Active (not suspended), Suspended,
   or Invalid.
  enum SubscriptionState {Active, Suspended, Invalid};
};
#endif
