## Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<http://ipr.etsi.org>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

---

## Foreword

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under <http://webapp.etsi.org/key/queryform.asp>.

---

## Modal verbs terminology

In the present document "**shall**", "**shall not**", "**should**", "**should not**", "**may**", "**may not**", "**need**", "**need not**", "**will**", "**will not**", "**can**" and "**cannot**" are to be interpreted as described in clause 3.2 of the [ETSI Drafting Rules](#) (Verbal forms for the expression of provisions).

"**must**" and "**must not**" are **NOT** allowed in ETSI deliverables except when used in direct citation.

# Foreword

This Technical Specification has been produced by the 3<sup>rd</sup> Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

---

# 1 Scope

The present document contains the definition of the LTE Positioning Protocol (LPP).

---

# 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

## 3 Definitions and Abbreviations

### 3.1 Definitions

For the purposes of the present document, the terms and definitions given in [1], [2] and [3] apply. Other definitions are provided below.

**Location Server:** a physical or logical entity (e.g., E-SMLC or SUPL SLP) that manages positioning for a target device by obtaining measurements and other location information from one or more positioning units and providing assistance data to positioning units to help determine this. A Location Server may also compute or verify the final location estimate.

**Reference Source:** a physical entity or part of a physical entity that provides signals (e.g., RF, acoustic, infra-red) that can be measured (e.g., by a Target Device) in order to obtain the location of a Target Device.

**Target Device:** the device that is being positioned (e.g., UE or SUPL SET).

**Observed Time Difference Of Arrival (OTDOA):** The time interval that is observed by a target device between the reception of downlink signals from two different cells. If a signal from cell 1 is received at the moment  $t_1$ , and a signal from cell 2 is received at the moment  $t_2$ , the OTDOA is  $t_2 - t_1$ .

### 3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply.

|         |  |
|---------|--|
| ADR     | Accumulated Delta-Range                            |
| A-GNSS  | Assisted-GNSS                                      |
| ARFCN   | Absolute Radio Frequency Channel Number            |
| BDS     | BeiDou Navigation Satellite System                 |
| BTS     | Base Transceiver Station (GERAN)                   |
| CID     | Cell-ID (positioning method)                       |
| CNAV    | Civil Navigation                                   |
| CRS     | Cell-specific Reference Signals                    |
| ECEF    | Earth-Centered, Earth-Fixed                        |
| E-CGI   | Evolved Cell Global Identifier                     |
| ECI     | Earth-Centered-Inertial                            |
| E-CID   | Enhanced Cell-ID (positioning method)              |
| EGNOS   | European Geostationary Navigation Overlay Service  |
| E-SMLC  | Enhanced Serving Mobile Location Centre            |
| E-UTRAN | Evolved Universal Terrestrial Radio Access Network |

## 4 Functionality of Protocol

### 4.1 General

#### 4.1.1 LPP Configuration

LPP is used point-to-point between a location server (E-SMLC or SLP) and a target device (UE or SET) in order to position the target device using position-related measurements obtained by one or more reference sources. Figure 4.1.1-1 shows the configuration as applied to the control- and user-plane location solutions for E-UTRAN (as defined in [2] and [3]).

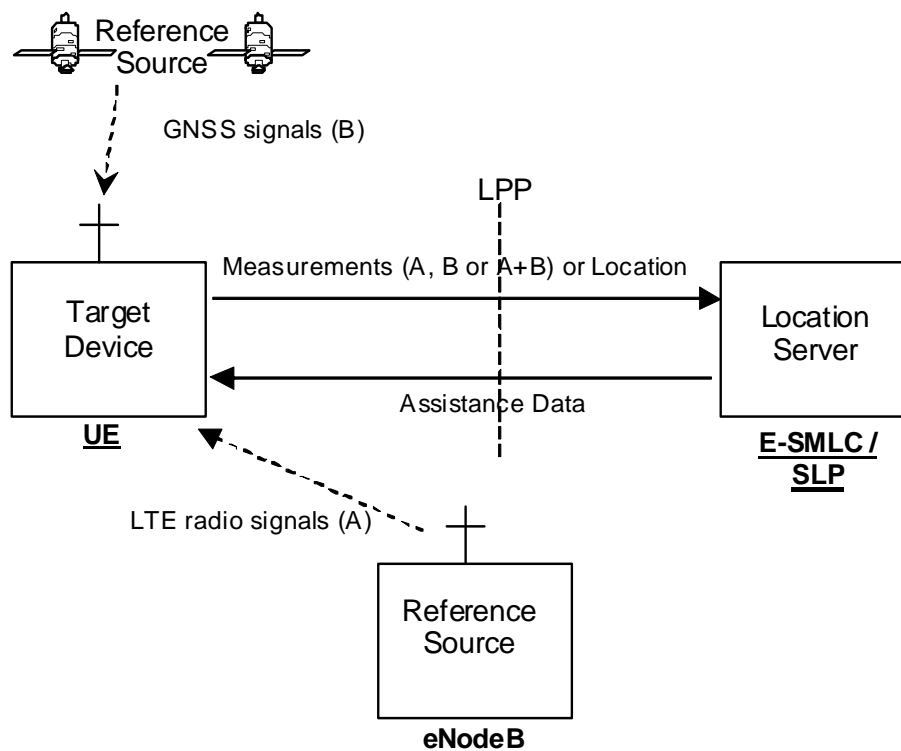

Figure 4.1.1-1: LPP Configuration for Control- and User-Plane Positioning in E-UTRAN

#### 4.1.2 LPP Sessions and Transactions

An LPP session is used between a Location Server and the target device in order to obtain location related measurements or a location estimate or to transfer assistance data. A single LPP session is used to support a single location request (e.g., for a single MT-LR, MO-LR or NI-LR). Multiple LPP sessions can be used between the same endpoints to support multiple different location requests (as required by [3]). Each LPP session comprises one or more LPP transactions, with each LPP transaction performing a single operation (capability exchange, assistance data transfer, or location information transfer). In E-UTRAN the LPP transactions are realized as LPP procedures. The instigator of an LPP session will always instigate the first LPP transaction, but subsequent transactions may be instigated by either end. LPP transactions within a session may occur serially or in parallel. LPP transactions are indicated at the LPP protocol level with a transaction ID in order to associate messages with one another (e.g., request and response).

Messages within a transaction are linked by a common transaction identifier.

#### 4.1.3 LPP Position Methods

Internal LPP positioning methods and associated signalling content are defined in this specification.

This version of the specification defines OTDOA, A-GNSS, and E-CID positioning methods.

#### 4.1.4 LPP Messages

Each LPP transaction involves the exchange of one or more LPP messages between the location server and the target device. The general format of an LPP message consists of a set of common fields followed by a body. The body (which may be empty) contains information specific to a particular message type. Each message type contains information specific to one or more positioning methods and/or information common to all positioning methods.

The common fields are as follows:

| Field                | Role  |
|----------------------|---|
| Transaction ID       | Identify messages belonging to the same transaction                           |
| Transaction End Flag | Indicate when a transaction (e.g. one with periodic responses) has ended      |
| Sequence Number      | Enable detection of a duplicate LPP message at a receiver                     |
| Acknowledgement      | Enable an acknowledgement to be requested and/or returned for any LPP message |

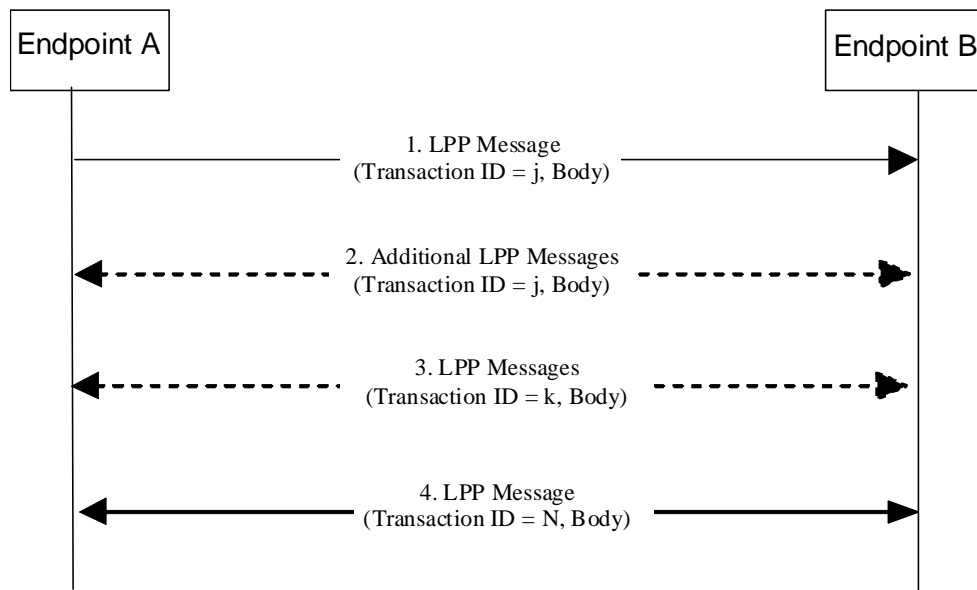

NOTE: Use of the Transaction ID and Transaction End fields conform to the procedures in clause 5 and are independent of the means used to transport LPP messages (e.g., whether using a NAS MO-LR Request, NAS Generic Transport or user-plane solution).

The following message types are defined:

- Request Capabilities;
- Provide Capabilities;
- Request Assistance Data;
- Provide Assistance Data;
- Request Location Information;
- Provide Location Information;
- Abort;
- Error.

## 4.2 Common LPP Session Procedure

The purpose of this procedure is to support an LPP session comprising a sequence of LPP transactions. The procedure is described in Figure 4.2-1.

**Figure 4.2-1 LPP Session Procedure**

1. Endpoint A, which may be either the target or the server, initiates an LPP session by sending an LPP message for an initial LPP transaction  $j$  to the other endpoint B (which has an opposite role to A).
2. Endpoints A and B may exchange further messages to continue the transaction started in step 1.
3. Either endpoint may instigate further transactions by sending additional LPP messages.
4. A session is terminated by a final transaction  $N$  in which LPP messages will be exchanged between the two endpoints.

Within each transaction, all constituent messages shall contain the same transaction identifier. The last message sent in each transaction shall have the IE *endTransaction* set to TRUE. Transactions that occur in parallel shall use different transaction IDs; transaction IDs for completed transactions may be reused at any time after the final message of the previous transaction with the same ID is known to have been received.

## 4.3 LPP Transport

### 4.3.1 Transport Layer Requirements

LPP requires reliable, in-sequence delivery of LPP messages from the underlying transport layers. This section describes the transport capabilities that are available within LPP. A UE implementing LPP for the control-plane solution shall support LPP reliable transport (including all three of duplicate detection, acknowledgement, and retransmission).

LPP reliable transport functionality is not used in the user-plane solution.

The following requirements in subclauses 4.3.2, 4.3.3, and 4.3.4 for LPP reliable transport apply only when the capability is supported.

### 4.3.2 LPP Duplicate Detection

A sender shall include a sequence number in all LPP messages sent for a particular location session. The sequence number shall be distinct for different LPP messages sent in the same direction in the same location session (e.g., may start at zero in the first LPP message and increase monotonically in each succeeding LPP message). Sequence numbers used in the uplink and downlink are independent (e.g., can be the same).

A receiver shall record the most recent received sequence number for each location session. If a message is received carrying the same sequence number as that last received for the associated location session, it shall be discarded. Otherwise (i.e., if the sequence number is different or if no sequence number was previously received or if no sequence number is included), the message shall be processed.

Sending and receiving sequence numbers shall be deleted in a server when the associated location session is terminated and shall be deleted in a target device when there has been no activity for a particular location session for 10 minutes.

NOTE: For LPP control-plane use, a target device can be aware of a location session from information provided at the NAS level for downlink transport of an LPP message.

### 4.3.3 LPP Acknowledgement

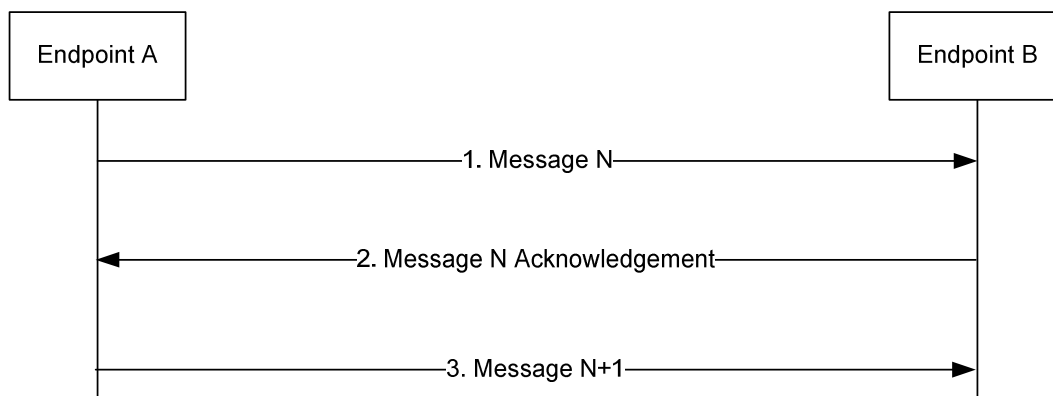

#### 4.3.3.1 General

Each LPP message may carry an acknowledgement request and/or an acknowledgement indicator. A LPP message including an acknowledgement request (i.e., that include the IE *ackRequested* set to TRUE) shall also include a sequence number. Upon reception of an LPP message which includes the IE *ackRequested* set to TRUE, a receiver returns an LPP message with an acknowledgement response (i.e., that includes the *ackIndicator* IE set to the same sequence number of the message being acknowledged). An acknowledgement response may contain no LPP message body (in which case only the sequence number being acknowledged is significant); alternatively, the acknowledgement may be sent in an LPP message along with an LPP message body. An acknowledgement is returned for each received LPP message that requested an acknowledgement including any duplicate(s). Once a sender receives an acknowledgement for an LPP message, and provided any included sequence number is matching, it is permitted to send the next LPP message. No message reordering is needed at the receiver since this stop-and-wait method of sending ensures that messages normally arrive in the correct order.

When an LPP message is transported via a NAS MO-LR request, the message does not request an acknowledgement.

#### 4.3.3.2 Procedure related to Acknowledgement

Figure 4.3.3.2-1 shows the procedure related to acknowledgement.

**Figure 4.3.3.2-1: LPP Acknowledgement procedure**

1. Endpoint A sends an LPP message *N* to Endpoint B which includes the IE *ackRequested* set to TRUE and a sequence number.
2. If LPP message *N* is received and Endpoint B is able to decode the *ackRequested* value and sequence number, Endpoint B shall return an acknowledgement for message *N*. The acknowledgement shall contain the IE *ackIndicator* set to the same sequence number as that in message *N*.
3. When the acknowledgement for LPP message *N* is received and provided the included *ackIndicator* IE matches the sequence number sent in message *N*, Endpoint A sends the next LPP message *N+1* to Endpoint B when this message is available.

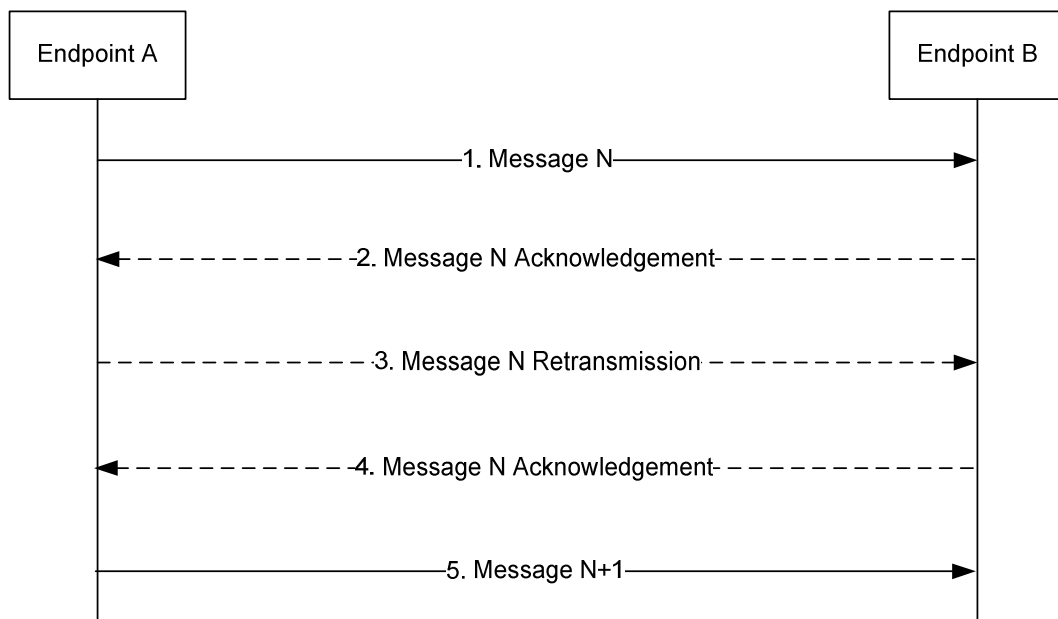

## 4.3.4 LPP Retransmission

### 4.3.4.1 General

This capability builds on the acknowledgement and duplicate detection capabilities. When an LPP message which requires acknowledgement is sent and not acknowledged, it is resent by the sender following a timeout period up to three times. If still unacknowledged after that, the sender aborts all LPP activity for the associated session. The timeout period is determined by the sender implementation but shall not be less than a minimum value of 250ms.

### 4.3.4.2 Procedure related to Retransmission

Figure 4.3.4.2-1 shows the procedure related to retransmission when combined with acknowledgement and duplicate detection.

**Figure 4.3.4.2-1: LPP Retransmission procedure**

1. Endpoint A sends an LPP message  $N$  to Endpoint B for a particular location session and includes a request for acknowledgement along with a sequence number.
2. If LPP message  $N$  is received and Endpoint B is able to decode the *ackRequested* value and sequence number (regardless of whether the message body can be correctly decoded), Endpoint B shall return an acknowledgement for message  $N$ . If the acknowledgement is received by Endpoint A (such that the acknowledged message can be identified and sequence numbers are matching), Endpoint A skips steps 3 and 4.
3. If the acknowledgement in step 2 is not received after a timeout period, Endpoint A shall retransmit LPP message  $N$  and shall include the same sequence number as in step 1.
4. If LPP message  $N$  in step 3 is received and Endpoint B is able to decode the *ackRequested* value and sequence number (regardless of whether the message body can be correctly decoded and whether or not the message is considered a duplicate), Endpoint B shall return an acknowledgement. Steps 3 may be repeated one or more times if the acknowledgement in step 4 is not received after a timeout period by Endpoint A. If the acknowledgement in step 4 is still not received after sending three retransmissions, Endpoint A shall abort all procedures and activity associated with LPP support for the particular location session.
5. Once an acknowledgement in step 2 or step 4 is received, Endpoint A sends the next LPP message  $N+1$  for the location session to Endpoint B when this message is available.

## 5 LPP Procedures

### 5.1 Procedures related to capability transfer

The purpose of the procedures that are grouped together in this section is to enable the transfer of capabilities from the target device to the server. Capabilities in this context refer to positioning and protocol capabilities related to LPP and the positioning methods supported by LPP.

These procedures instantiate the Capability Transfer transaction from 3GPP TS 36.305 [2].

#### 5.1.1 Capability Transfer procedure

The Capability Transfer procedure is shown in Figure 5.1.1-1.

**Figure 5.1.1-1: LPP Capability Transfer procedure**

1. The server sends a *RequestCapabilities* message to the target. The server may indicate the types of capability needed.
2. The target responds with a *ProvideCapabilities* message to the server. The capabilities shall correspond to any capability types specified in step 1. This message shall include the *endTransaction* IE set to TRUE.

#### 5.1.2 Capability Indication procedure

The Capability Indication procedure allows the target to provide unsolicited capabilities to the server and is shown in Figure 5.1.2-1.

**Figure 5.1.2-1: LPP Capability Indication procedure**

1. The target sends a *ProvideCapabilities* message to the server. This message shall include the *endTransaction* IE set to TRUE.

### 5.1.3 Reception of LPP Request Capabilities

Upon receiving a *RequestCapabilities* message, the target device shall generate a *ProvideCapabilities* message as a response.

The target device shall:

- 1> for each positioning method for which a request for capabilities is included in the message:
  - 2> if the target device supports this positioning method:
    - 3> include the capabilities of the device for that supported positioning method in the response message;
- 1> set the IE *LPP-TransactionID* in the response message to the same value as the IE *LPP-TransactionID* in the received message;
- 1> deliver the response message to lower layers for transmission.

### 5.1.4 Transmission of LPP Provide Capabilities

When triggered to transmit a *ProvideCapabilities* message, the target device shall:

- 1> for each positioning method whose capabilities are to be indicated:
  - 2> set the corresponding IE to include the device"s capabilities;
  - 2> if OTDOA capabilities are to be indicated:
    - 3> include the IE *supportedBandListEUTRA*;
- 1> deliver the response to lower layers for transmission.

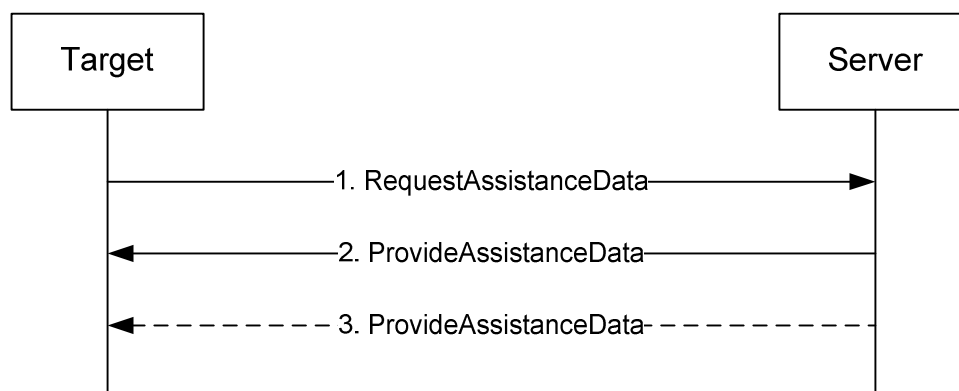

## 5.2 Procedures related to Assistance Data Transfer

The purpose of the procedures in this section is to enable the target to request assistance data from the server to assist in positioning, and to enable the server to transfer assistance data to the target in the absence of a request.

These procedures instantiate the Assistance Data Transfer transaction from 3GPP TS 36.305 [2].

### 5.2.1 Assistance Data Transfer procedure

The Assistance Data Transfer procedure is shown in Figure 5.2.1-1.

**Figure 5.2.1-1: LPP Assistance data transfer procedure**

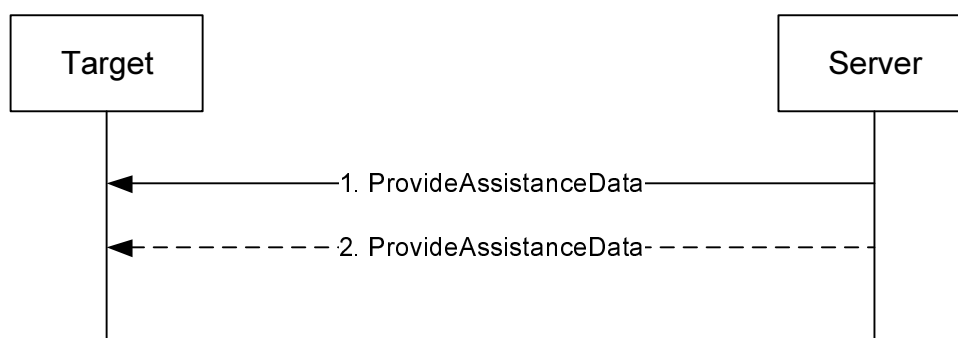

1. The target sends a *RequestAssistanceData* message to the server.
2. The server responds with a *ProvideAssistanceData* message to the target containing assistance data. The transferred assistance data should match or be a subset of the assistance data requested in step 1. The server may

also provide any not requested information that it considers useful to the target . If step 3 does not occur, this message shall set the *endTransaction* IE to TRUE.

3. The server may transmit one or more additional *ProvideAssistanceData* messages to the target containing further assistance data. The transferred assistance data should match or be a subset of the assistance data requested in step 1. The server may also provide any not requested information that it considers useful to the target. The last message shall include the *endTransaction* IE set to TRUE.

## 5.2.2 Assistance Data Delivery procedure

The Assistance Data Delivery procedure allows the server to provide unsolicited assistance data to the target and is shown in Figure 5.2.2-1.

**Figure 5.2.2-1: LPP Assistance data transfer procedure**

1. The server sends a *ProvideAssistanceData* message to the target containing assistance data. If step 2 does not occur, this message shall set the *endTransaction* IE to TRUE.
2. The server may transmit one or more additional *ProvideAssistanceData* messages to the target containing additional assistance data. The last message shall include the *endTransaction* IE set to TRUE.

## 5.2.3 Transmission of LPP Request Assistance Data

When triggered to transmit a *RequestAssistanceData* message, the target device shall:

- 1> set the IEs for the positioning-method-specific request for assistance data to request the data indicated by upper layers.

## 5.2.4 Reception of LPP Provide Assistance Data

Upon receiving a *ProvideAssistanceData* message, the target device shall:

- 1> for each positioning method contained in the message:
  - 2> deliver the related assistance data to upper layers.

## 5.3 Procedures related to Location Information Transfer

The purpose of the procedures in this section is to enable the server to request location measurement data and/or a location estimate from the target, and to enable the target to transfer location measurement data and/or a location estimate to a server in the absence of a request.

These procedures instantiate the Location Information Transfer transaction in 3GPP TS 36.305 [2].

**NOTE:** The service layer (e.g. NAS or OMA SUPL ULP) would be used to transfer information associated with a location request from a target to a server (MO-LR).

### 5.3.1 Location Information Transfer procedure

The Location Information Transfer procedure is shown in Figure 5.3.1-1.

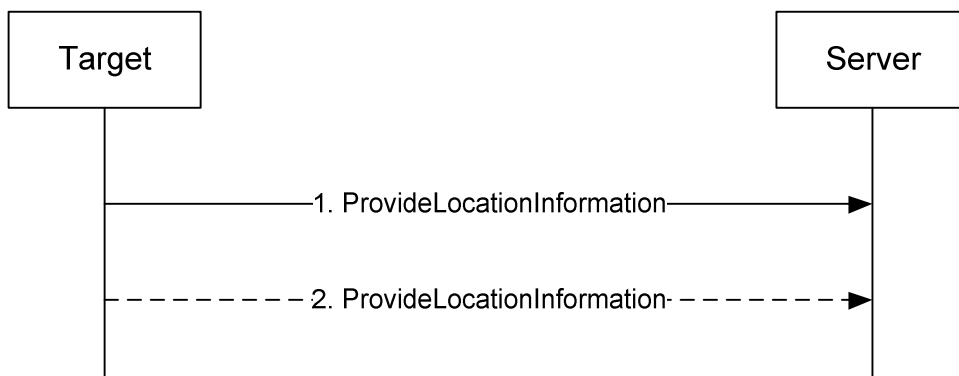

**Figure 5.3.1-1: LPP Location Information transfer procedure**

1. The server sends a *RequestLocationInformation* message to the target to request location information, indicating the type of location information needed and potentially the associated QoS.
2. The target sends a *ProvideLocationInformation* message to the server to transfer location information. The location information transferred should match or be a subset of the location information requested in step 1 unless the server explicitly allows additional location information. If step 3 does not occur, this message shall set the *endTransaction* IE to TRUE.
3. If requested in step 1, the target sends additional *ProvideLocationInformation* messages to the server to transfer location information. The location information transferred should match or be a subset of the location information requested in step 1 unless the server explicitly allows additional location information. The last message shall include the *endTransaction* IE set to TRUE.

### 5.3.2 Location Information Delivery procedure

The Location Information Delivery allows the target to provide unsolicited location information to the server. The procedure is shown in Figure 5.3.2-1.

**Figure 5.3.2-1: LPP Location Information Delivery procedure**

1. The target sends a *ProvideLocationInformation* message to the server to transfer location information. If step 2 does not occur, this message shall set the *endTransaction* IE to TRUE.

2. The target may send one or more additional *ProvideLocationInformation* messages to the server containing additional location information data. The last message shall include the *endTransaction* IE set to TRUE.

### 5.3.3 Reception of Request Location Information

Upon receiving a *RequestLocationInformation* message, the target device shall:

- 1> if the requested information is compatible with the target device capabilities and configuration:
  - 2> include the requested information in a *ProvideLocationInformation* message;
  - 2> set the IE *LPP-TransactionID* in the response to the same value as the IE *LPP-TransactionID* in the received message;
  - 2> deliver the *ProvideLocationInformation* message to lower layers for transmission.
- 1> otherwise:
  - 2> if one or more positioning methods are included that the target device does not support:
    - 3> continue to process the message as if it contained only information for the supported positioning methods;
    - 3> handle the signaling content of the unsupported positioning methods by LPP error detection as in 5.4.3.

### 5.3.4 Transmission of Provide Location Information

When triggered to transmit *ProvideLocationInformation* message, the target device shall:

- 1> for each positioning method contained in the message:
  - 2> set the corresponding IE to include the available location information;
- 1> deliver the response to lower layers for transmission.

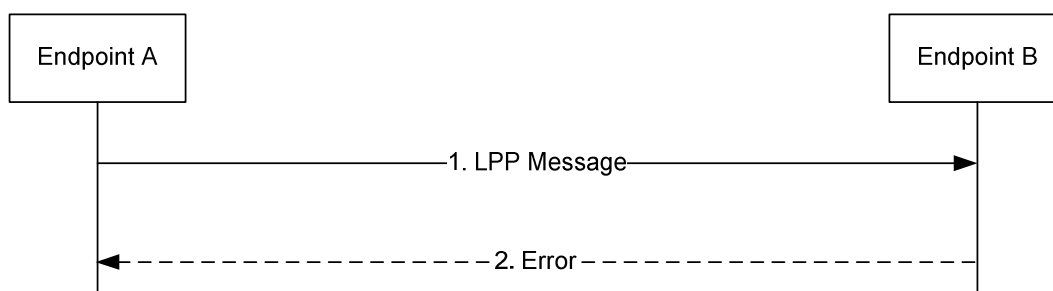

## 5.4 Error Handling Procedures

### 5.4.1 General

This sub-clause describes how a receiving entity (target device or location server) behaves in cases when it receives erroneous or unexpected data or detects that certain data are missing.

### 5.4.2 Procedures related to Error Indication

Figure 5.4.2-1 shows the Error indication procedure.

**Figure 5.4.2-1: LPP Error Indication procedure**

1. Endpoint A sends an LPP message to Endpoint B.

2. Endpoint B determines that the LPP message in step 1 contains an error. Endpoint B returns an *Error* message to Endpoint A indicating the error or errors and discards the message in step 1. If Endpoint B is able to determine that the erroneous LPP message in step 1 is an LPP Error or Abort Message, Endpoint B discards the message in step 1 without returning an *Error* message to Endpoint A.

### 5.4.3 LPP Error Detection

Upon receiving any LPP message, the receiving entity shall attempt to decode the message and verify the presence of any errors and:

- 1> if decoding errors are encountered:
  - 2> if the receiver can not determine that the received message is an LPP *Error* or *Abort* message:
    - 3> return an LPP *Error* message to the sender and include the received *LPP-TransactionID*, if this was decoded, and type of error;
    - 3> discard the received message and stop the error detection procedure;
- 1> if the message is a duplicate of a previously received message:
  - 2> discard the message and stop the error detection procedure;
- 1> if the *LPP-TransactionID* matches the *LPP-TransactionID* for a procedure that is still ongoing for the same session and the message type is invalid for the current state of the procedure:
  - 2> abort the ongoing procedure;
  - 2> return an LPP *Error* message to the sender and include the received transaction ID and type of error;
  - 2> discard the message and stop the error detection procedure;
- 1> if the message type is an LPP *RequestCapabilities* and some of the requested information is not supported:
  - 2> return any information that can be provided in a normal response.
- 1> if the message type is an LPP *RequestAssistanceData* or *RequestLocationInformation* and some or all of the requested information is not supported:
  - 2> return any information that can be provided in a normal response, which includes indications on other information that is not supported.

### 5.4.4 Reception of an LPP Error Message

Upon receiving an *Error* message, a device shall:

- 1> abort any ongoing procedure associated with the *LPP-TransactionID* if included in the received message.

The device may:

- 1> restart the aborted procedure taking into consideration the returned error information.

## 5.5 Abort Procedure

### 5.5.1 General

The purpose of the abort procedure is to allow the target device or location server to abort an ongoing procedure due to some unexpected event (e.g., cancellation of a location request by an LCS client). It can also be used to stop an ongoing procedure (e.g., periodic location reporting from the target device).

## 5.5.2 Procedures related to Abort

Figure 5.5.2-1 shows the Abort procedure.

**Figure 5.5.2-1: LPP Abort procedure**

1. A procedure P is ongoing between endpoints A and B.
2. Endpoint A determines that the procedure must be aborted and sends an *Abort* message to Endpoint B carrying the transaction ID for procedure P. Endpoint B aborts procedure P.

## 5.5.3 Reception of an LPP Abort Message

Upon receiving an *Abort* message, a device shall:

- 1> abort any ongoing procedure associated with the transaction ID indicated in the message.

---

# 6 Information Element Abstract Syntax Definition

## 6.1 General

The contents of each LPP message is specified in sub-clause 6.2 using ASN.1 to specify the message syntax and using tables when needed to provide further detailed information about the information elements specified in the message syntax.

The ASN.1 in this section uses the same format and coding conventions as described in Annex A of [12].

Transfer syntax for LPP messages is derived from their ASN.1 definitions by use of Basic Packed Encoding Rules (BASIC-PER), Unaligned Variant, as specified in ITU-T Rec. X.691 [22]. The encoded LPP message always contains a multiple of 8 bits.

Transfer syntax for LPP IEs is derived from their ASN.1 definitions by use of Basic Packed Encoding Rules (BASIC-PER), Unaligned Variant, as specified in ITU-T Rec. X.691 [22]. The encoded LPP IE always contains a multiple of 8 bits. This applies when a single LPP IE is encoded as the basic production, i.e. for other purposes than encoding the LPP IE within an LPP message.

The need for information elements to be present in a message or an abstract type, i.e., the ASN.1 fields that are specified as OPTIONAL in the abstract notation (ASN.1), is specified by means of comment text tags attached to the OPTIONAL statement in the abstract syntax. The meaning of each tag is specified in table 6.1-1. These tags are used in the downlink (server to target) direction only.

**Table 6.1-1: Meaning of abbreviations used to specify the need for information elements to be present**

| Abbreviation | Meaning |
|--------------|---------|
|--------------|---------|

| Abbreviation             | Meaning  |
|--------------------------|--|
| Cond <i>conditionTag</i> | <i>Conditionally present</i><br>An information element for which the need is specified by means of conditions. For each <i>conditionTag</i> , the need is specified in a tabular form following the ASN.1 segment. In case, according to the conditions, a field is not present, the target takes no action and where applicable shall continue to use the existing value (and/or the associated functionality) unless explicitly stated otherwise in the description of the field itself. |
| Need OP                  | <i>Optionally present</i><br>An information element that is optional to signal. For downlink messages, the target is not required to take any special action on absence of the IE beyond what is specified in the procedural text or the field description table following the ASN.1 segment. The target behaviour on absence should be captured either in the procedural text or in the field description.  |
| Need ON                  | <i>Optionally present, No action</i><br>An information element that is optional to signal. If the message is received by the target, and in case the information element is absent, the target takes no action and where applicable shall continue to use the existing value (and/or the associated functionality).  |
| Need OR                  | <i>Optionally present, Release</i><br>An information element that is optional to signal. If the message is received by the target, and in case the information element is absent, the target shall discontinue/ stop using/ delete any existing value (and/ or the associated functionality).  |

When specifying information elements which are to be represented by BIT STRINGS, if not otherwise specifically stated in the field description of the concerned IE or elsewhere, the following principle applies with regards to the ordering of bits:

- The first bit (leftmost bit) contains the most significant bit (MSB);
- the last bit (rightmost bit) contains the least significant bit (LSB).

## 6.2 LPP PDU Structure

### – LPP-PDU-Definitions

This ASN.1 segment is the start of the LPP PDU definitions.

```
-- ASN1START

LPP-PDU-Definitions {
itu-t (0) identified-organization (4) etsi (0) mobileDomain (0)
eps-Access (21) modules (3) lpp (7) version1 (1) lpp-PDU-Definitions (1) }

DEFINITIONS AUTOMATIC TAGS ::=

BEGIN

-- ASN1STOP
```

### – LPP-Message

The *LPP-Message* provides the complete set of information for an invocation or response pertaining to an LPP transaction.

```
-- ASN1START

LPP-Message ::= SEQUENCE {
  transactionID      LPP-TransactionID  OPTIONAL,  -- Need ON
  endTransaction    BOOLEAN,
  sequenceNumber    SequenceNumber     OPTIONAL,  -- Need ON
  acknowledgement   Acknowledgement    OPTIONAL,  -- Need ON
  lpp-MessageBody   LPP-MessageBody    OPTIONAL  -- Need ON
}

SequenceNumber ::= INTEGER (0..255)

Acknowledgement ::= SEQUENCE {
```

```

    ackRequested    BOOLEAN,
    ackIndicator    SequenceNumber    OPTIONAL
}
-- ASN1STOP

```

### **LPP-Message field descriptions**

|   |
|---|
| <b>transactionID</b>  |
| This field is omitted if an <i>lpp-MessageBody</i> is not present (i.e. in an LPP message sent only to acknowledge a previously received message) or if it is not available to the transmitting entity (e.g., in an <i>LPP-Error</i> message triggered by a message that could not be parsed). If present, this field shall be ignored at a receiver in an LPP message for which the <i>lpp-MessageBody</i> is not present. |
| <b>endTransaction</b>   |
| This field indicates whether an LPP message is the last message carrying an <i>lpp-MessageBody</i> in a transaction (TRUE) or not last (FALSE).   |
| <b>sequenceNumber</b>   |
| This field may be included when LPP operates over the control plane and an <i>lpp-MessageBody</i> is included but shall be omitted otherwise.   |
| <b>acknowledgement</b>  |
| This field is included in an LPP acknowledgement and in any LPP message requesting an acknowledgement when LPP operates over the control plane and is omitted otherwise   |
| <b>ackRequested</b>   |
| This field indicates whether an LPP acknowledgement is requested (TRUE) or not (FALSE). A value of TRUE may only be included when an <i>lpp-MessageBody</i> is included.  |
| <b>ackIndicator</b>   |
| This field indicates the sequence number of the message being acknowledged.   |
| <b>lpp-MessageBody</b>  |
| This field may be omitted in case the message is sent only to acknowledge a previously received message.  |

## – LPP-MessageBody

The *LPP-MessageBody* identifies the type of an LPP message and contains all LPP information specifically associated with that type.

```

-- ASN1START
LPP-MessageBody ::= CHOICE {
    c1 CHOICE {
        requestCapabilities    RequestCapabilities,
        provideCapabilities     ProvideCapabilities,
        requestAssistanceData   RequestAssistanceData,
        provideAssistanceData   ProvideAssistanceData,
        requestLocationInformation RequestLocationInformation,
        provideLocationInformation ProvideLocationInformation,
        abort                   Abort,
        error                    Error,
        spare7 NULL, spare6 NULL, spare5 NULL, spare4 NULL,
        spare3 NULL, spare2 NULL, spare1 NULL, spare0 NULL
    },
    messageClassExtension SEQUENCE {}
}
-- ASN1STOP

```

## – LPP-TransactionID

The *LPP-TransactionID* identifies a particular LPP transaction and the initiator of the transaction.

```

-- ASN1START
LPP-TransactionID ::= SEQUENCE {
    initiator    Initiator,
    transactionNumber TransactionNumber,
    ...
}
Initiator ::= ENUMERATED {
    locationServer,

```

```

    targetDevice,
    ...
}
TransactionNumber ::= INTEGER (0..255)
-- ASN1STOP

```

## 6.3 Message Body IEs

### – RequestCapabilities

The *RequestCapabilities* message body in a LPP message is used by the location server to request the target device capability information for LPP and the supported individual positioning methods.

```

-- ASN1START
RequestCapabilities ::= SEQUENCE {
    criticalExtensions      CHOICE {
        c1                  CHOICE {
            requestCapabilities-r9      RequestCapabilities-r9-IEs,
            spare3 NULL, spare2 NULL, spare1 NULL
        },
        criticalExtensionsFuture      SEQUENCE {}
    }
}

RequestCapabilities-r9-IEs ::= SEQUENCE {
    commonIEsRequestCapabilities      CommonIEsRequestCapabilities      OPTIONAL, -- Need ON
    a-gnss-RequestCapabilities        A-GNSS-RequestCapabilities        OPTIONAL, -- Need ON
    otdoa-RequestCapabilities          OTDOA-RequestCapabilities          OPTIONAL, -- Need ON
    ecid-RequestCapabilities           ECID-RequestCapabilities           OPTIONAL, -- Need ON
    epdu-RequestCapabilities           EPDU-Sequence                     OPTIONAL, -- Need ON
    ...
}
-- ASN1STOP

```

#### **RequestCapabilities field descriptions**

##### **commonIEsRequestCapabilities**

This IE is provided for future extensibility and should not be included in this version of the protocol.

### – ProvideCapabilities

The *ProvideCapabilities* message body in a LPP message indicates the LPP capabilities of the target device to the location server.

```

-- ASN1START
ProvideCapabilities ::= SEQUENCE {
    criticalExtensions      CHOICE {
        c1                  CHOICE {
            provideCapabilities-r9      ProvideCapabilities-r9-IEs,
            spare3 NULL, spare2 NULL, spare1 NULL
        },
        criticalExtensionsFuture      SEQUENCE {}
    }
}

ProvideCapabilities-r9-IEs ::= SEQUENCE {
    commonIEsProvideCapabilities      CommonIEsProvideCapabilities      OPTIONAL,
    a-gnss-ProvideCapabilities        A-GNSS-ProvideCapabilities        OPTIONAL,
    otdoa-ProvideCapabilities          OTDOA-ProvideCapabilities          OPTIONAL,
    ecid-ProvideCapabilities           ECID-ProvideCapabilities           OPTIONAL,
    epdu-ProvideCapabilities           EPDU-Sequence                     OPTIONAL,
    ...
}
-- ASN1STOP

```

**ProvideCapabilities field descriptions****commonIEsProvideCapabilities**

This IE is provided for future extensibility and should not be included in this version of the protocol.

– **RequestAssistanceData**

The *RequestAssistanceData* message body in a LPP message is used by the target device to request assistance data from the location server.

```
-- ASN1START
RequestAssistanceData ::= SEQUENCE {
    criticalExtensions      CHOICE {
        c1                  CHOICE {
            requestAssistanceData-r9      RequestAssistanceData-r9-IEs,
            spare3 NULL, spare2 NULL, spare1 NULL
        },
        criticalExtensionsFuture      SEQUENCE {}
    }
}

RequestAssistanceData-r9-IEs ::= SEQUENCE {
    commonIEsRequestAssistanceData      CommonIEsRequestAssistanceData      OPTIONAL,
    a-gnss-RequestAssistanceData        A-GNSS-RequestAssistanceData        OPTIONAL,
    otdoa-RequestAssistanceData         OTDOA-RequestAssistanceData         OPTIONAL,
    epdu-RequestAssistanceData          EPDU-Sequence                       OPTIONAL,
    ...
}
-- ASN1STOP
```

– **ProvideAssistanceData**

The *ProvideAssistanceData* message body in a LPP message is used by the location server to provide assistance data to the target device either in response to a request from the target device or in an unsolicited manner.

```
-- ASN1START
ProvideAssistanceData ::= SEQUENCE {
    criticalExtensions      CHOICE {
        c1                  CHOICE {
            provideAssistanceData-r9      ProvideAssistanceData-r9-IEs,
            spare3 NULL, spare2 NULL, spare1 NULL
        },
        criticalExtensionsFuture      SEQUENCE {}
    }
}

ProvideAssistanceData-r9-IEs ::= SEQUENCE {
    commonIEsProvideAssistanceData      CommonIEsProvideAssistanceData      OPTIONAL,  -- Need ON
    a-gnss-ProvideAssistanceData        A-GNSS-ProvideAssistanceData        OPTIONAL,  -- Need ON
    otdoa-ProvideAssistanceData         OTDOA-ProvideAssistanceData         OPTIONAL,  -- Need ON
    epdu-Provide-Assistance-Data        EPDU-Sequence                       OPTIONAL,  -- Need ON
    ...
}
-- ASN1STOP
```

**ProvideAssistanceData field descriptions****commonIEsProvideAssistanceData**

This IE is provided for future extensibility and should not be included in this version of the protocol.

## – RequestLocationInformation

The *RequestLocationInformation* message body in a LPP message is used by the location server to request positioning measurements or a position estimate from the target device.

```
-- ASN1START
RequestLocationInformation ::= SEQUENCE {
    criticalExtensions      CHOICE {
        c1                  CHOICE {
            requestLocationInformation-r9  RequestLocationInformation-r9-IEs,
            spare3 NULL, spare2 NULL, spare1 NULL
        },
        criticalExtensionsFuture  SEQUENCE {}
    }
}

RequestLocationInformation-r9-IEs ::= SEQUENCE {
    commonIEsRequestLocationInformation
        CommonIEsRequestLocationInformation  OPTIONAL, -- Need ON
    a-gnss-RequestLocationInformation  A-GNSS-RequestLocationInformation  OPTIONAL, -- Need ON
    otdoa-RequestLocationInformation  OTDOA-RequestLocationInformation  OPTIONAL, -- Need ON
    ecid-RequestLocationInformation  ECID-RequestLocationInformation  OPTIONAL, -- Need ON
    epdu-RequestLocationInformation  EPDU-Sequence  OPTIONAL, -- Need ON
    ...
}
-- ASN1STOP
```

### **RequestLocationInformation field descriptions**

#### **commonIEsRequestLocationInformation**

This field specifies the location information type requested by the location server and optionally other configuration information associated with the requested location information. This field should always be included in this version of the protocol.

## – ProvideLocationInformation

The *ProvideLocationInformation* message body in a LPP message is used by the target device to provide positioning measurements or position estimates to the location server.

```
-- ASN1START
ProvideLocationInformation ::= SEQUENCE {
    criticalExtensions      CHOICE {
        c1                  CHOICE {
            provideLocationInformation-r9  ProvideLocationInformation-r9-IEs,
            spare3 NULL, spare2 NULL, spare1 NULL
        },
        criticalExtensionsFuture  SEQUENCE {}
    }
}

ProvideLocationInformation-r9-IEs ::= SEQUENCE {
    commonIEsProvideLocationInformation
        CommonIEsProvideLocationInformation  OPTIONAL,
    a-gnss-ProvideLocationInformation  A-GNSS-ProvideLocationInformation  OPTIONAL,
    otdoa-ProvideLocationInformation  OTDOA-ProvideLocationInformation  OPTIONAL,
    ecid-ProvideLocationInformation  ECID-ProvideLocationInformation  OPTIONAL,
    epdu-ProvideLocationInformation  EPDU-Sequence  OPTIONAL,
    ...
}
-- ASN1STOP
```

## – Abort

The *Abort* message body in a LPP message carries a request to abort an ongoing LPP procedure.

```
-- ASN1START
```

```

Abort ::= SEQUENCE {
    criticalExtensions      CHOICE {
        c1                  CHOICE {
            abort-r9        Abort-r9-IEs,
            spare3 NULL, spare2 NULL, spare1 NULL
        },
        criticalExtensionsFuture SEQUENCE {}
    }
}

Abort-r9-IEs ::= SEQUENCE {
    commonIEsAbort      CommonIEsAbort      OPTIONAL, -- Need ON
    ...,
    epdu-Abort          EPDU-Sequence        OPTIONAL -- Need ON
}

-- ASN1STOP

```

## – Error

The *Error* message body in a LPP message carries information concerning a LPP message that was received with errors.

```

-- ASN1START

Error ::= CHOICE {
    error-r9              Error-r9-IEs,
    criticalExtensionsFuture SEQUENCE {}
}

Error-r9-IEs ::= SEQUENCE {
    commonIEsError      CommonIEsError      OPTIONAL, -- Need ON
    ...,
    epdu-Error          EPDU-Sequence        OPTIONAL -- Need ON
}

-- ASN1STOP

```

## 6.4 Common IEs

Common IEs comprise IEs that are applicable to more than one LPP positioning method.

### 6.4.1 Common Lower-Level IEs

#### – AccessTypes

The IE *AccessTypes* is used to indicate several cellular access types using a bit map.

```

-- ASN1START

AccessTypes ::= SEQUENCE {
    accessTypes      BIT STRING {
        eutra      (0),
        utra       (1),
        gsm        (2) } (SIZE (1..8)),
    ...
}

-- ASN1STOP

```

#### **AccessTypes field descriptions**

##### **accessTypes**

This field specifies the cellular access type(s). This is represented by a bit string, with a one-value at the bit position means the particular access type is addressed; a zero-value means not addressed.

## – ARFCN-ValueEUTRA

The IEs *ARFCN-ValueEUTRA* and *ARFCN-ValueEUTRA-v9a0* are used to indicate the ARFCN of the E-UTRA carrier frequency, as defined in [12].

```
-- ASN1START
ARFCN-ValueEUTRA ::= INTEGER (0..maxEARFCN)
ARFCN-ValueEUTRA-v9a0 ::= INTEGER (maxEARFCN-Plus1..maxEARFCN2)
maxEARFCN                INTEGER ::= 65535    -- Maximum value of EUTRA carrier frequency
maxEARFCN-Plus1          INTEGER ::= 65536    -- Lowest value extended EARFCN range
maxEARFCN2                INTEGER ::= 262143  -- Highest value extended EARFCN range
-- ASN1STOP
```

NOTE: For fields using the original value range, as defined by IE *ARFCN-ValueEUTRA* i.e. without suffix, value *maxEARFCN* indicates that the E-UTRA carrier frequency is indicated by means of an extension.

## – ARFCN-ValueUTRA

The IE *ARFCN-ValueUTRA* is used to indicate the ARFCN of the UTRA carrier frequency, as defined in [13].

```
-- ASN1START
ARFCN-ValueUTRA ::= INTEGER (0..16383)
-- ASN1STOP
```

## – CellGlobalIdEUTRA-AndUTRA

The IE *CellGlobalIdEUTRA-AndUTRA* specifies the global Cell Identifier for E-UTRA or UTRA, the globally unique identity of a cell in E-UTRA or UTRA.

```
-- ASN1START
CellGlobalIdEUTRA-AndUTRA ::= SEQUENCE {
  plmn-Identity      SEQUENCE {
    mcc      SEQUENCE (SIZE (3)) OF INTEGER (0..9),
    mnc      SEQUENCE (SIZE (2..3)) OF INTEGER (0..9)
  },
  cellIdentity      CHOICE {
    eutra  BIT STRING (SIZE (28)),
    utra   BIT STRING (SIZE (32))
  },
  ...
}
-- ASN1STOP
```

### **CellGlobalIdEUTRA-AndUTRA field descriptions**

#### ***plmn-Identity***

This field identifies the PLMN of the cell as defined in [12].

#### ***cellIdentity***

This field defines the identity of the cell within the context of the PLMN as defined in [12] and [13]. The size of the bit string allows for the 32-bit extended UTRAN cell ID; in case the cell ID is shorter, the first bits of the string are set to 0.

## – CellGlobalIdGERAN

The IE *CellGlobalIdGERAN* specifies the global Cell Identifier for GERAN, the globally unique identity of a cell in GERAN.

```
-- ASN1START
```

```

CellGlobalIdGERAN ::= SEQUENCE {
  plmn-Identity      SEQUENCE {
    mcc      SEQUENCE (SIZE (3))    OF INTEGER (0..9),
    mnc      SEQUENCE (SIZE (2..3)) OF INTEGER (0..9)
  },
  locationAreaCode  BIT STRING (SIZE (16)),
  cellIdentity      BIT STRING (SIZE (16)),
  ...
}
-- ASN1STOP

```

#### CellGlobalIdGERAN field descriptions

##### **plmn-Identity**

This field identifies the PLMN of the cell.

##### **locationAreaCode**

This field is a fixed length code identifying the location area within a PLMN.

##### **cellIdentity**

This field specifies the cell Identifier which is unique within the context of the GERAN location area.

## – ECGI

The IE *ECGI* specifies the Evolved Cell Global Identifier (ECGI), the globally unique identity of a cell in E-UTRA [12].

```

-- ASN1START
ECGI ::= SEQUENCE {
  mcc      SEQUENCE (SIZE (3))    OF INTEGER (0..9),
  mnc      SEQUENCE (SIZE (2..3)) OF INTEGER (0..9),
  cellidentity  BIT STRING (SIZE (28))
}
-- ASN1STOP

```

## – Ellipsoid-Point

The IE *Ellipsoid-Point* is used to describe a geographic shape as defined in 3GPP TS 23.032 [15].

```

-- ASN1START
Ellipsoid-Point ::= SEQUENCE {
  latitudeSign      ENUMERATED {north, south},
  degreesLatitude   INTEGER (0..8388607),          -- 23 bit field
  degreesLongitude  INTEGER (-8388608..8388607)    -- 24 bit field
}
-- ASN1STOP

```

## – Ellipsoid-PointWithUncertaintyCircle

The IE *Ellipsoid-PointWithUncertaintyCircle* is used to describe a geographic shape as defined in 3GPP TS 23.032 [15].

```

-- ASN1START
Ellipsoid-PointWithUncertaintyCircle ::= SEQUENCE {
  latitudeSign      ENUMERATED {north, south},
  degreesLatitude   INTEGER (0..8388607),          -- 23 bit field
  degreesLongitude  INTEGER (-8388608..8388607),  -- 24 bit field
  uncertainty       INTEGER (0..127)
}
-- ASN1STOP

```

## – EllipsoidPointWithUncertaintyEllipse

The IE *EllipsoidPointWithUncertaintyEllipse* is used to describe a geographic shape as defined in 3GPP TS 23.032 [15].

```
-- ASN1START
EllipsoidPointWithUncertaintyEllipse ::= SEQUENCE {
    latitudeSign          ENUMERATED {north, south},
    degreesLatitude      INTEGER (0..8388607),          -- 23 bit field
    degreesLongitude     INTEGER (-8388608..8388607),  -- 24 bit field
    uncertaintySemiMajor INTEGER (0..127),
    uncertaintySemiMinor INTEGER (0..127),
    orientationMajorAxis INTEGER (0..179),
    confidence           INTEGER (0..100)
}
-- ASN1STOP
```

## – EllipsoidPointWithAltitude

The IE *EllipsoidPointWithAltitude* is used to describe a geographic shape as defined in 3GPP TS 23.032 [15].

```
-- ASN1START
EllipsoidPointWithAltitude ::= SEQUENCE {
    latitudeSign          ENUMERATED {north, south},
    degreesLatitude      INTEGER (0..8388607),          -- 23 bit field
    degreesLongitude     INTEGER (-8388608..8388607),  -- 24 bit field
    altitudeDirection    ENUMERATED {height, depth},
    altitude             INTEGER (0..32767)             -- 15 bit field
}
-- ASN1STOP
```

## – EllipsoidPointWithAltitudeAndUncertaintyEllipsoid

The IE *EllipsoidPointWithAltitudeAndUncertaintyEllipsoid* is used to describe a geographic shape as defined in 3GPP TS 23.032 [15].

```
-- ASN1START
EllipsoidPointWithAltitudeAndUncertaintyEllipsoid ::= SEQUENCE {
    latitudeSign          ENUMERATED {north, south},
    degreesLatitude      INTEGER (0..8388607),          -- 23 bit field
    degreesLongitude     INTEGER (-8388608..8388607),  -- 24 bit field
    altitudeDirection    ENUMERATED {height, depth},
    altitude             INTEGER (0..32767),           -- 15 bit field
    uncertaintySemiMajor INTEGER (0..127),
    uncertaintySemiMinor INTEGER (0..127),
    orientationMajorAxis INTEGER (0..179),
    uncertaintyAltitude  INTEGER (0..127),
    confidence           INTEGER (0..100)
}
-- ASN1STOP
```

## – EllipsoidArc

The IE *EllipsoidArc* is used to describe a geographic shape as defined in 3GPP TS 23.032 [15].

```
-- ASN1START
EllipsoidArc ::= SEQUENCE {
    latitudeSign          ENUMERATED {north, south},
    degreesLatitude      INTEGER (0..8388607),          -- 23 bit field
    degreesLongitude     INTEGER (-8388608..8388607),  -- 24 bit field
    innerRadius          INTEGER (0..65535),           -- 16 bit field,
    uncertaintyRadius    INTEGER (0..127),
}
```

```

offsetAngle          INTEGER (0..179),
includedAngle        INTEGER (0..179),
confidence            INTEGER (0..100)
}
-- ASN1STOP

```

## – EPDU-Sequence

The *EPDU-Sequence* contains IEs that are defined externally to LPP by other organizations.

```

-- ASN1START
EPDU-Sequence ::= SEQUENCE (SIZE (1..maxEPDU)) OF EPDU
maxEPDU INTEGER ::= 16
EPDU ::= SEQUENCE {
    ePDU-Identifier    EPDU-Identifier,
    ePDU-Body          EPDU-Body
}
EPDU-Identifier ::= SEQUENCE {
    ePDU-ID            EPDU-ID,
    ePDU-Name          EPDU-Name    OPTIONAL,
    ...
}
EPDU-ID ::= INTEGER (1..256)
EPDU-Name ::= VisibleString (SIZE (1..32))
EPDU-Body ::= OCTET STRING
-- ASN1STOP

```

### **EPDU-Sequence field descriptions**

#### **EPDU-ID**

This field provides a unique integer ID for the externally defined positioning method. Its value is assigned to the external entity that defines the EPDU. See table External PDU Identifier Definition for a list of external PDU identifiers defined in this version of the specification.

#### **EPDU-Name**

This field provides an optional character encoding which can be used to provide a quasi-unique name for an external PDU – e.g., by containing the name of the defining organization and/or the name of the associated public or proprietary standard for the EPDU.

#### **EPDU-Body**

The content and encoding of this field are defined externally to LPP.

### **External PDU Identifier Definition**

| <b>EPDU-ID</b> | <b>EPDU Defining entity</b> | <b>Method name</b>        | <b>Reference</b>         |
|----------------|-----------------------------|---------------------------|--------------------------|
| 1              | OMA LOC                     | OMA LPP extensions (LPPe) | OMA-TS-LPPe-V1_0<br>[20] |

## – HorizontalVelocity

The IE *HorizontalVelocity* is used to describe a velocity shape as defined in 3GPP TS 23.032 [15].

```

-- ASN1START
HorizontalVelocity ::= SEQUENCE {
    bearing            INTEGER(0..359),
    horizontalSpeed    INTEGER(0..2047)
}
-- ASN1STOP

```

## – HorizontalWithVerticalVelocity

The IE *HorizontalWithVerticalVelocity* is used to describe a velocity shape as defined in 3GPP TS 23.032 [15].

```
-- ASN1START
HorizontalWithVerticalVelocity ::= SEQUENCE {
    bearing                INTEGER(0..359),
    horizontalSpeed        INTEGER(0..2047),
    verticalDirection      ENUMERATED{upward, downward},
    verticalSpeed          INTEGER(0..255)
}
-- ASN1STOP
```

## – HorizontalVelocityWithUncertainty

The IE *HorizontalVelocityWithUncertainty* is used to describe a velocity shape as defined in 3GPP TS 23.032 [15].

```
-- ASN1START
HorizontalVelocityWithUncertainty ::= SEQUENCE {
    bearing                INTEGER(0..359),
    horizontalSpeed        INTEGER(0..2047),
    uncertaintySpeed       INTEGER(0..255)
}
-- ASN1STOP
```

## – HorizontalWithVerticalVelocityAndUncertainty

The IE *HorizontalWithVerticalVelocityAndUncertainty* is used to describe a velocity shape as defined in 3GPP TS 23.032 [15].

```
-- ASN1START
HorizontalWithVerticalVelocityAndUncertainty ::= SEQUENCE {
    bearing                INTEGER(0..359),
    horizontalSpeed        INTEGER(0..2047),
    verticalDirection      ENUMERATED{upward, downward},
    verticalSpeed          INTEGER(0..255),
    horizontalUncertaintySpeed  INTEGER(0..255),
    verticalUncertaintySpeed  INTEGER(0..255)
}
-- ASN1STOP
```

## – LocationCoordinateTypes

The IE *LocationCoordinateTypes* defines a list of possible geographic shapes as defined in 3GPP TS 23.032 [15].

```
-- ASN1START
LocationCoordinateTypes ::= SEQUENCE {
    ellipsoidPoint                BOOLEAN,
    ellipsoidPointWithUncertaintyCircle  BOOLEAN,
    ellipsoidPointWithUncertaintyEllipse  BOOLEAN,
    polygon                        BOOLEAN,
    ellipsoidPointWithAltitude        BOOLEAN,
    ellipsoidPointWithAltitudeAndUncertaintyEllipsoid  BOOLEAN,
    ellipsoidArc                    BOOLEAN,
    ...
}
-- ASN1STOP
```

## – Polygon

The IE *Polygon* is used to describe a geographic shape as defined in 3GPP TS 23.032 [15].

```
-- ASN1START
Polygon ::= SEQUENCE (SIZE (3..15)) OF PolygonPoints
PolygonPoints ::= SEQUENCE {
    latitudeSign          ENUMERATED {north, south},
    degreesLatitude      INTEGER (0..8388607),          -- 23 bit field
    degreesLongitude     INTEGER (-8388608..8388607)   -- 24 bit field
}
-- ASN1STOP
```

## – PositioningModes

The IE *PositioningModes* is used to indicate several positioning modes using a bit map.

```
-- ASN1START
PositioningModes ::= SEQUENCE {
    posModes             BIT STRING {
        standalone (0),
        ue-based (1),
        ue-assisted (2) } (SIZE (1..8)),
    ...
}
-- ASN1STOP
```

### **PositioningModes field descriptions**

#### ***posModes***

This field specifies the positioning mode(s). This is represented by a bit string, with a one-value at the bit position means the particular positioning mode is addressed; a zero-value means not addressed.

## – VelocityTypes

The IE *VelocityTypes* defines a list of possible velocity shapes as defined in 3GPP TS 23.032 [15].

```
-- ASN1START
VelocityTypes ::= SEQUENCE {
    horizontalVelocity          BOOLEAN,
    horizontalWithVerticalVelocity    BOOLEAN,
    horizontalVelocityWithUncertainty  BOOLEAN,
    horizontalWithVerticalVelocityAndUncertainty  BOOLEAN,
    ...
}
-- ASN1STOP
```

## 6.4.2 Common Positioning

### – CommonIEsRequestCapabilities

The *CommonIEsRequestCapabilities* carries common IEs for a Request Capabilities LPP message Type.

```
-- ASN1START
CommonIEsRequestCapabilities ::= SEQUENCE {
    ...
}
-- ASN1STOP
```

## – CommonIEsProvideCapabilities

The *CommonIEsProvideCapabilities* carries common IEs for a Provide Capabilities LPP message Type.

```
-- ASN1START
CommonIEsProvideCapabilities ::= SEQUENCE {
    ...
}
-- ASN1STOP
```

## – CommonIEsRequestAssistanceData

The *CommonIEsRequestAssistanceData* carries common IEs for a Request Assistance Data LPP message Type.

```
-- ASN1START
CommonIEsRequestAssistanceData ::= SEQUENCE {
    primaryCellID      ECGI      OPTIONAL,  -- Cond EUTRA
    ...
}
-- ASN1STOP
```

| Conditional presence | Explanation  |
|----------------------|--|
| <i>EUTRA</i>         | The field is mandatory present for E-UTRA access. The field shall be omitted for non-EUTRA user plane support. |

| <i>CommonIEsRequestAssistanceData</i> field descriptions   |
|--|
| <b><i>primaryCellID</i></b><br>This parameter identifies the current primary cell for the target device. |

## – CommonIEsProvideAssistanceData

The *CommonIEsProvideAssistanceData* carries common IEs for a Provide Assistance Data LPP message Type.

```
-- ASN1START
CommonIEsProvideAssistanceData ::= SEQUENCE {
    ...
}
-- ASN1STOP
```

## – CommonIEsRequestLocationInformation

The *CommonIEsRequestLocationInformation* carries common IEs for a Request Location Information LPP message Type.

```
-- ASN1START
CommonIEsRequestLocationInformation ::= SEQUENCE {
    locationInformationType      LocationInformationType,
    triggeredReporting            TriggeredReportingCriteria  OPTIONAL,  -- Cond ECID
    periodicalReporting          PeriodicalReportingCriteria  OPTIONAL,  -- Need ON
    additionalInformation        AdditionalInformation          OPTIONAL,  -- Need ON
    qos                          QoS                          OPTIONAL,  -- Need ON
    environment                  Environment                OPTIONAL,  -- Need ON
    locationCoordinateTypes      LocationCoordinateTypes  OPTIONAL,  -- Need ON
    velocityTypes                VelocityTypes            OPTIONAL,  -- Need ON
    ...
}
LocationInformationType ::= ENUMERATED {
```

```

locationEstimateRequired,
locationMeasurementsRequired,
locationEstimatePreferred,
locationMeasurementsPreferred,
...
}

PeriodicalReportingCriteria ::= SEQUENCE {
  reportingAmount      ENUMERATED {
    ra1, ra2, ra4, ra8, ra16, ra32,
    ra64, ra-Infinity
  } DEFAULT ra-Infinity,
  reportingInterval    ENUMERATED {
    noPeriodicalReporting, ri0-25,
    ri0-5, ri1, ri2, ri4, ri8, ri16, ri32, ri64
  }
}

TriggeredReportingCriteria ::= SEQUENCE {
  cellChange          BOOLEAN,
  reportingDuration    ReportingDuration,
  ...
}

ReportingDuration ::= INTEGER (0..255)

AdditionalInformation ::= ENUMERATED {
  onlyReturnInformationRequested,
  mayReturnAdditionalInformation,
  ...
}

QoS ::= SEQUENCE {
  horizontalAccuracy    HorizontalAccuracy    OPTIONAL,  -- Need ON
  verticalCoordinateRequest  BOOLEAN,
  verticalAccuracy      VerticalAccuracy      OPTIONAL,  -- Need ON
  responseTime          ResponseTime          OPTIONAL,  -- Need ON
  velocityRequest       BOOLEAN,
  ...
}

HorizontalAccuracy ::= SEQUENCE {
  accuracy      INTEGER(0..127),
  confidence     INTEGER(0..100),
  ...
}

VerticalAccuracy ::= SEQUENCE {
  accuracy      INTEGER(0..127),
  confidence     INTEGER(0..100),
  ...
}

ResponseTime ::= SEQUENCE {
  time          INTEGER (1..128),
  ...
}

Environment ::= ENUMERATED {
  badArea,
  notBadArea,
  mixedArea,
  ...
}

-- ASN1STOP

```

| Conditional presence | Explanation  |
|----------------------|--|
| ECID                 | The field is optionally present, need ON, if ECID is requested. Otherwise it is not present. |

|  |
|--|
| <b>CommonEsRequestLocationInformation field descriptions</b> |
|--|

**CommonEsRequestLocationInformation field descriptions****locationInformationType**

This IE indicates whether the server requires a location estimate or measurements. For "*locationEstimateRequired*", the target device shall return a location estimate if possible, or indicate a location error if not possible. For "*locationMeasurementsRequired*", the target device shall return measurements if possible, or indicate a location error if not possible. For "*locationEstimatePreferred*", the target device shall return a location estimate if possible, but may also or instead return measurements for any requested position methods for which a location estimate is not possible. For "*locationMeasurementsPreferred*", the target device shall return location measurements if possible, but may also or instead return a location estimate for any requested position methods for which return of location measurements is not possible.

**triggeredReporting**

This IE indicates that triggered reporting is requested and comprises the following subfields:

- **cellChange**: If this field is set to TRUE, the target device provides requested location information each time the primary cell has changed.
- **reportingDuration**: Maximum duration of triggered reporting in seconds. A value of zero is interpreted to mean an unlimited (i.e. "infinite") duration. The target device should continue triggered reporting for the *reportingDuration* or until an LPP *Abort* or LPP *Error* message is received.

The *triggeredReporting* field should not be included by the location server and shall be ignored by the target device if the *periodicalReporting* IE or *responseTime* IE is included in *CommonEsRequestLocationInformation*.

**periodicalReporting**

This IE indicates that periodic reporting is requested and comprises the following subfields:

- **reportingAmount** indicates the number of periodic location information reports requested. Enumerated values correspond to 1, 2, 4, 8, 16, 32, 64, or infinite/indefinite number of reports. If the *reportingAmount* is "*infinite/indefinite*", the target device should continue periodic reporting until an LPP *Abort* message is received. The value "*ra1*" shall not be used by a sender.
- **reportingInterval** indicates the interval between location information reports and the response time requirement for the first location information report. Enumerated values ri0-25, ri0-5, ri1, ri2, ri4, ri8, ri16, ri32, ri64 correspond to reporting intervals of 1, 2, 4, 8, 10, 16, 20, 32, and 64 seconds, respectively. Measurement reports containing no measurements or no location estimate are required when a *reportingInterval* expires before a target device is able to obtain new measurements or obtain a new location estimate. The value "*noPeriodicalReporting*" shall not be used by a sender.

**additionalInformation**

This IE indicates whether a target device is allowed to return additional information to that requested. If this IE indicates "*onlyReturnInformationRequested*" then the target device shall not return any additional information to that requested by the server. If this IE indicates "*mayReturnAdditionalInformation*" then the target device may return additional information to that requested by the server. If a location estimate is returned, any additional information is restricted to that associated with a location estimate (e.g. might include velocity if velocity was not requested but cannot include measurements). If measurements are returned, any additional information is restricted to additional measurements (e.g. might include E-CID measurements if A-GNSS measurements were requested but not E-CID measurements).

**qos**

This IE indicates the quality of service and comprises a number of sub-fields. In the case of measurements, some of the sub-fields apply to the location estimate that could be obtained by the server from the measurements provided by the target device assuming that the measurements are the only sources of error. Fields are as follows:

- **horizontalAccuracy** indicates the maximum horizontal error in the location estimate at an indicated confidence level. The "*accuracy*" corresponds to the encoded uncertainty as defined in 3GPP TS 23.032 [15] and "*confidence*" corresponds to confidence as defined in 3GPP TS 23.032 [15].
- **verticalCoordinateRequest** indicates whether a vertical coordinate is required (TRUE) or not (FALSE)
- **verticalAccuracy** indicates the maximum vertical error in the location estimate at an indicated confidence level and is only applicable when a vertical coordinate is requested. The "*accuracy*" corresponds to the encoded uncertainty altitude as defined in 3GPP TS 23.032 [15] and "*confidence*" corresponds to confidence as defined in 3GPP TS 23.032 [15].
- **responseTime** indicates the maximum response time as measured between receipt of the *RequestLocationInformation* and transmission of a *ProvideLocationInformation*. This is given as an integer number of seconds between 1 and 128. If the *periodicalReporting* IE is included in *CommonEsRequestLocationInformation*, this field should not be included by the location server and shall be ignored by the target device (if included).
- **velocityRequest** indicates whether velocity (or measurements related to velocity) is requested (TRUE) or not (FALSE).

All QoS requirements shall be obtained by the target device to the degree possible but it is permitted to return a response that does not fulfill all QoS requirements if some were not attainable. The single exception is response-time which shall always be fulfilled – even if that means not fulfilling other QoS requirements.

| <b><i>CommonIEsRequestLocationInformation</i> field descriptions</b>   |
|--|
| <p><b><i>environment</i></b><br/>           This field provides the target device with information about expected multipath and non line of sight (NLOS) in the current area. The following values are defined:</p> <ul style="list-style-type: none"> <li>• badArea: possibly heavy multipath and NLOS conditions (e.g. bad urban or urban).</li> <li>• notBadArea: no or light multipath and usually LOS conditions (e.g. suburban or rural).</li> <li>• mixedArea: environment that is mixed or not defined.</li> </ul> <p>If this field is absent, a default value of "mixedArea" applies.</p> |

| <p><b><i>velocityTypes</i></b><br/>           This fields provides a list of the types of velocity estimate that the target device may return when a velocity estimate is obtained by the target.</p>  |

## – CommonIEsProvideLocationInformation

The *CommonIEsProvideLocationInformation* carries common IEs for a Provide Location Information LPP message Type.

```
-- ASN1START

CommonIEsProvideLocationInformation ::= SEQUENCE {
    locationEstimate          LocationCoordinates    OPTIONAL,
    velocityEstimate          Velocity                OPTIONAL,
    locationError             LocationError          OPTIONAL,
    ...
}

LocationCoordinates ::= CHOICE {
    ellipsoidPoint                Ellipsoid-Point,
    ellipsoidPointWithUncertaintyCircle  Ellipsoid-PointWithUncertaintyCircle,
    ellipsoidPointWithUncertaintyEllipse  EllipsoidPointWithUncertaintyEllipse,
    polygon                        Polygon,
    ellipsoidPointWithAltitude      EllipsoidPointWithAltitude,
    ellipsoidPointWithAltitudeAndUncertaintyEllipsoid  EllipsoidPointWithAltitudeAndUncertaintyEllipsoid,
    ellipsoidArc                   EllipsoidArc,
    ...
}

Velocity ::= CHOICE {
    horizontalVelocity            HorizontalVelocity,
    horizontalWithVerticalVelocity  HorizontalWithVerticalVelocity,
    horizontalVelocityWithUncertainty  HorizontalVelocityWithUncertainty,
    horizontalWithVerticalVelocityAndUncertainty  HorizontalWithVerticalVelocityAndUncertainty,
    ...
}

LocationError ::= SEQUENCE {
    locationfailurecause          LocationFailureCause,
    ...
}

LocationFailureCause ::= ENUMERATED {
    undefined,
    requestedMethodNotSupported,
    positionMethodFailure,
    periodicLocationMeasurementsNotAvailable,
    ...
}

-- ASN1STOP
```

**CommonIEsProvideLocationInformation field descriptions****locationEstimate**

This field provides a location estimate using one of the geographic shapes defined in 3GPP TS 23.032 [15]. Coding of the values of the various fields internal to each geographic shape follow the rules in [15]. The conditions for including this field are defined for the *locationInformationType* field in a Request Location Information message.

**velocityEstimate**

This field provides a velocity estimate using one of the velocity shapes defined in 3GPP TS 23.032 [15]. Coding of the values of the various fields internal to each velocity shape follow the rules in [15].

**locationError**

This field shall be included if and only if a location estimate and measurements are not included in the LPP PDU. The field includes information concerning the reason for the lack of location information. The *LocationFailureCause* "periodicLocationMeasurementsNotAvailable" shall be used by the target device if periodic location reporting was requested, but no measurements or location estimate are available when *the reportingInterval* expired.

## – CommonIEsAbort

The *CommonIEsAbort* carries common IEs for an Abort LPP message Type.

```
-- ASN1START
CommonIEsAbort ::= SEQUENCE {
  abortCause      ENUMERATED {
    undefined,
    stopPeriodicReporting,
    targetDeviceAbort,
    networkAbort,
    ...
  }
}
-- ASN1STOP
```

**CommonIEsAbort field descriptions****abortCause**

This IE defines the request to abort an ongoing procedure. The abort cause "stopPeriodicReporting" should be used by the location server to stop any ongoing location reporting configured as *periodicalReporting* or *triggeredReporting* in the *CommonIEsRequestLocationInformation*.

## – CommonIEsError

The *CommonIEsError* carries common IEs for an Error LPP message Type.

```
-- ASN1START
CommonIEsError ::= SEQUENCE {
  errorCause      ENUMERATED {
    undefined,
    lppMessageHeaderError,
    lppMessageBodyError,
    epduError,
    incorrectDataValue,
    ...
  }
}
-- ASN1STOP
```

**CommonIEsError field descriptions****errorCause**

This IE defines the cause for an error. "lppMessageHeaderError", "lppMessageBodyError" and "epduError" is used if a receiver is able to detect a coding error in the LPP header (i.e., in the common fields), LPP message body or in an EPDU, respectively.

## 6.5 Positioning Method IEs

### 6.5.1 OTDOA Positioning

#### 6.5.1.1 OTDOA Assistance Data

##### – OTDOA-ProvideAssistanceData

The IE *OTDOA-ProvideAssistanceData* is used by the location server to provide assistance data to enable UE-assisted downlink OTDOA. It may also be used to provide OTDOA positioning specific error reason.

Throughout Section 6.5.1, "assistance data reference cell" refers to the cell defined by the IE *OTDOA-ReferenceCellInfo* (see section 6.5.1.2). "RSTD reference cell" applies only in Section 6.5.1.5.

**NOTE:** The location server should include at least one cell for which the SFN can be obtained by the target device, e.g. the serving cell, in the assistance data, either as the assistance data reference cell or in the neighbour cell list. Otherwise the target device will be unable to perform the OTDOA measurement and the positioning operation will fail.

```
-- ASN1START
OTDOA-ProvideAssistanceData ::= SEQUENCE {
    otdoa-ReferenceCellInfo      OTDOA-ReferenceCellInfo      OPTIONAL, -- Need ON
    otdoa-NeighbourCellInfo     OTDOA-NeighbourCellInfoList  OPTIONAL, -- Need ON
    otdoa-Error                  OTDOA-Error                  OPTIONAL, -- Need ON
    ...
}
-- ASN1STOP
```

#### 6.5.1.2 OTDOA Assistance Data Elements

##### – OTDOA-ReferenceCellInfo

The IE *OTDOA-ReferenceCellInfo* is used by the location server to provide assistance data reference cell information for OTDOA assistance data. The slot number offsets and expected RSTDs in *OTDOA-NeighbourCellInfoList* are provided relative to the cell defined by this IE. If *earfcnRef* of this assistance data reference cell is different from that of the serving cell, the LPP layer shall inform lower layers to start performing inter-frequency RSTD measurements with this cell and provide to lower layers the information about this assistance data reference cell, e.g. EARFCN and PRS positioning occasion information.

**NOTE:** The location server should always include the PRS configuration of the assistance data reference and neighbour cells. Otherwise the UE may not meet the accuracy requirements as defined in [18].

```
-- ASN1START
OTDOA-ReferenceCellInfo ::= SEQUENCE {
    physCellId                INTEGER (0..503),
    cellGlobalId              ECGI                        OPTIONAL, -- Need ON
    earfcnRef                  ARFCN-ValueEUTRA           OPTIONAL, -- Cond NotSameAsServ0
    antennaPortConfig         ENUMERATED {ports1-or-2, ports4, ... }
                                OPTIONAL, -- Cond NotSameAsServ1
    cpLength                   ENUMERATED { normal, extended, ... },
    prsInfo                    PRS-Info                   OPTIONAL, -- Cond PRS
    ...
    [[ earfcnRef-v9a0          ARFCN-ValueEUTRA-v9a0      OPTIONAL -- Cond NotSameAsServ2
    ]]
}
-- ASN1STOP
```

| Conditional presence  | Explanation   |
|-----------------------|---|
| <i>NotSameAsServ0</i> | This field is absent if <i>earfcnRef-v9a0</i> is present. Otherwise, the field is mandatory present if the EARFCN of the OTDOA assistance data reference cell is not the same as the EARFCN of the target devices"s current primary cell. |
| <i>NotSameAsServ1</i> | The field is mandatory present if the antenna port configuration of the OTDOA assistance data reference cell is not the same as the antenna port configuration of the target devices"s current primary cell.                              |
| <i>NotSameAsServ2</i> | The field is absent if <i>earfcnRef</i> is present. Otherwise, the field is mandatory present if the EARFCN of the OTDOA assistance data reference cell is not the same as the EARFCN of the target devices"s current primary cell.       |
| <i>PRS</i>            | The field is mandatory present if positioning reference signals are available in the assistance data reference cell [16]; otherwise it is not present.  |

| <b>OTDOA-ReferenceCellInfo field descriptions</b>  |
|--|
| <b><i>physCellId</i></b><br>This field specifies the physical cell identity of the assistance data reference cell, as defined in [12].   |
| <b><i>cellGlobalId</i></b><br>This field specifies the ECGI, the globally unique identity of a cell in E-UTRA, of the assistance data reference cell, as defined in [12]. The server should include this field if it considers that it is needed to resolve ambiguity in the cell indicated by <i>physCellId</i> . |
| <b><i>earfcnRef</i></b><br>This field specifies the EARFCN of the assistance data reference cell.  |
| <b><i>antennaPortConfig</i></b><br>This field specifies whether 1 (or 2) antenna port(s) or 4 antenna ports for cell specific reference signals (CRS) are used in the assistance data reference cell.  |
| <b><i>cpLength</i></b><br>This field specifies the cyclic prefix length of the assistance data reference cell PRS if the <i>prsInfo</i> field is present, otherwise this field specifies the cyclic prefix length of the assistance data reference cell CRS.   |
| <b><i>prsInfo</i></b><br>This field specifies the PRS configuration of the assistance data reference cell.   |

## – PRS-Info

The IE *PRS-Info* provides the information related to the configuration of PRS in a cell.

```
-- ASN1START
PRS-Info ::= SEQUENCE {
    prs-Bandwidth          ENUMERATED { n6, n15, n25, n50, n75, n100, ... },
    prs-ConfigurationIndex INTEGER (0..4095),
    numDL-Frames          ENUMERATED { sf-1, sf-2, sf-4, sf-6, ... },
    ...,
    prs-MutingInfo-r9     CHOICE {
        po2-r9             BIT STRING (SIZE(2)),
        po4-r9             BIT STRING (SIZE(4)),
        po8-r9             BIT STRING (SIZE(8)),
        po16-r9            BIT STRING (SIZE(16)),
        ...
    }
}
-- ASN1STOP
```

| <b>PRS-Info field descriptions</b>   |
|--|
| <b><i>prs-Bandwidth</i></b><br>This field specifies the bandwidth that is used to configure the positioning reference signals on. Enumerated values are specified in number of resource blocks (n6 corresponds to 6 resource blocks, n15 to 15 resource blocks and so on) and define 1.4, 3, 5, 10, 15 and 20 MHz bandwidth. |
| <b><i>prs-ConfigurationIndex</i></b><br>This field specifies the positioning reference signals configuration index $I_{PRS}$ as defined in [16].   |
| <b><i>numDL-Frames</i></b><br>This field specifies the number of consecutive downlink subframes $N_{PRS}$ with positioning reference signals, as defined in [16]. Enumerated values define 1, 2, 4, or 6 consecutive subframes.  |

**PRS-Info field descriptions****prs-MutingInfo**

This field specifies the PRS muting configuration of the cell. The PRS muting configuration is defined by a periodic PRS muting sequence with periodicity  $T_{REP}$  where  $T_{REP}$ , counted in the number of PRS positioning occasions [18], can be 2, 4, 8, or 16 which is also the length of the selected bit string that represents this PRS muting sequence. If a bit in the PRS muting sequence is set to "0", then the PRS is muted in the corresponding PRS positioning occasion. A PRS positioning occasion comprises of  $N_{PRS}$  downlink positioning subframes as defined in [16]. The first bit of the PRS muting sequence corresponds to the first PRS positioning occasion that starts after the beginning of the assistance data reference cell SFN=0. The sequence is valid for all subframes after the target device has received the *prs-MutingInfo*. If this field is not present the target device may assume that the PRS muting is not in use for the cell.

When the SFN of the assistance data reference cell is not known to the UE and *prs-MutingInfo* is provided for a cell in the *OTDOA-NeighbourCellInfoList* IE, the UE may assume no PRS is transmitted by that cell.

When the UE receives a 16-bit muting pattern (po16-r9) and PRS periodicity  $T_{PRS}$  of 1280 subframes for the same cell, the UE shall assume an 8-bit muting pattern (po8-r9) based on the first half of the 16-bit muting pattern.

**OTDOA-NeighbourCellInfoList**

The IE *OTDOA-NeighbourCellInfoList* is used by the location server to provide neighbour cell information for OTDOA assistance data. If the target device is not capable of supporting additional neighbour cells (as indicated by the absence of the IE *additionalNeighbourCellInfoList* in *OTDOA-ProvideCapabilities*), the set of cells in the *OTDOA-NeighbourCellInfoList* is grouped per frequency layer and in the decreasing order of priority for measurement to be performed by the target device, with the first cell in the list being the highest priority for measurement and with the same *earfcn* not appearing in more than one instance of *OTDOA-NeighbourFreqInfo*.

If the target device is capable of supporting additional neighbour cells (as indicated by the presence of the IE *additionalNeighbourCellInfoList* in *OTDOA-ProvideCapabilities*), the list may contain all cells (up to 3x24 cells) belonging to the same frequency layer or cells from different frequency layers with the first cell in the list still being the highest priority for measurement.

The prioritization of the cells in the list is left to server implementation. The target device should provide the available measurements in the same order as provided by the server.

If inter-frequency neighbour cells are included in *OTDOA-NeighbourCellInfoList*, where an inter-frequency is a E-UTRA frequency which is different from the E-UTRA serving cell frequency, the LPP layer shall inform lower layers to start performing inter-frequency RSTD measurements for these neighbour cells and also provide to lower layers the information about these neighbour cells, e.g. EARFCN and PRS positioning occasion information.

```
-- ASN1START

OTDOA-NeighbourCellInfoList ::= SEQUENCE (SIZE (1..maxFreqLayers)) OF OTDOA-NeighbourFreqInfo

| <i>InterFreq</i>     | The field is optionally present, need OP, if the EARFCN is not the same as for the assistance data reference cell; otherwise it is not present.  |

#### **OTDOA-NeighbourCellInfoList field descriptions**

|  |
|--|
| <b><i>physCellId</i></b><br>This field specifies the physical cell identity of the neighbour cell, as defined in [12].   |
| <b><i>cellGlobalId</i></b><br>This field specifies the ECGI, the globally unique identity of a cell in E-UTRA, of the neighbour cell, as defined in [12]. The server should provide this field if it considers that it is needed to resolve any ambiguity in the cell identified by <i>physCellId</i> .  |
| <b><i>earfcn</i></b><br>This field specifies the EARFCN of the neighbour cell.   |
| <b><i>cpLength</i></b><br>This field specifies the cyclic prefix length of the neighbour cell PRS if PRS are present in this neighbour cell, otherwise this field specifies the cyclic prefix length of CRS in this neighbour cell.  |
| <b><i>prsInfo</i></b><br>This field specifies the PRS configuration of the neighbour cell.<br>When the EARFCN of the neighbour cell is the same as for the assistance data reference cell, the target device may assume that each PRS positioning occasion in the neighbour cell at least partially overlaps with a PRS positioning occasion in the assistance data reference cell where the maximum offset between the transmitted PRS positioning occasions may be assumed to not exceed half a subframe.<br>When the EARFCN of the neighbour cell is the same as for the assistance data reference cell, the target may assume that this cell has the same PRS periodicity ( $T_{prs}$ ) as the assistance data reference cell.   |
| <b><i>antennaPortConfig</i></b><br>This field specifies whether 1 (or 2) antenna port(s) or 4 antenna ports for cell specific reference signals are used.  |
| <b><i>slotNumberOffset</i></b><br>This field specifies the slot number offset at the transmitter between this cell and the assistance data reference cell. The <i>slotNumberOffset</i> together with the current slot number of the assistance data reference cell may be used to calculate the current slot number of this cell which may further be used to generate the CRS sequence by the target device. The offset corresponds to the number of full slots counted from the beginning of a radio frame of the assistance data reference cell to the beginning of the closest subsequent radio frame of this cell. If this field is absent, the slot timing is the same as for the assistance data reference cell.  |
| <b><i>prs-SubframeOffset</i></b><br>This field specifies the offset between the first PRS subframe in the assistance data reference cell on the reference carrier frequency layer and the first PRS subframe in the closest subsequent PRS positioning occasion of this cell on the other carrier frequency layer. The value is given in number of full sub-frames. If the EARFCN is not the same as for the assistance data reference cell and the field is not present but PRS are available on this cell, the receiver shall consider the PRS subframe offset for this cell to be 0.  |
| <b><i>expectedRSTD</i></b><br>If PRS is transmitted:<br><br>This field indicates the RSTD value that the target device is expected to measure between this cell and the assistance data reference cell. The <i>expectedRSTD</i> field takes into account the expected propagation time difference as well as transmit time difference of PRS positioning occasions between the two cells. The RSTD value can be negative and is calculated as ( <i>expectedRSTD</i> -8192). The resolution is $3 \times T_s$ , with $T_s = 1/(15000 \times 2048)$ seconds.<br><br>If PRS is not transmitted:<br><br>This field indicates the RSTD value that the target device is expected to measure between this cell and the assistance data reference cell. The <i>expectedRSTD</i> field takes into account the expected propagation time difference as well as transmit time difference between the two cells. The RSTD value can be negative and is calculated as ( <i>expectedRSTD</i> -8192). The resolution is $3 T_s$ , with $T_s = 1/(15000 \times 2048)$ seconds. |

**OTDOA-NeighbourCellInfoList field descriptions****expectedRSTD-Uncertainty**

If PRS is transmitted:

This field indicates the uncertainty in *expectedRSTD* value. The uncertainty is related to the location server's a-priori estimation of the target device location. The *expectedRSTD* and *expectedRSTD-Uncertainty* together define the search window for the target device.

The scale factor of the *expectedRSTD-Uncertainty* field is  $3 \times T_s$ , with  $T_s = 1 / (15000 \times 2048)$  seconds.

The target device may assume that the beginning of the PRS positioning occasion of the neighbour cell is received within the search window of size  $[- \text{expectedRSTD-Uncertainty} \times 3 \times T_s, \text{expectedRSTD-Uncertainty} \times 3 \times T_s]$  centered at  $T_{\text{REF}} + 1 \text{ millisecond} \times N + (\text{expectedRSTD} - 8192) \times 3 \times T_s$ , where  $T_{\text{REF}}$  is the reception time of the beginning of the PRS positioning occasion of the assistance data reference cell at the target device antenna connector,  $N = 0$  when the EARFCN of the neighbour cell is equal to that of the assistance data reference cell, and  $N = \text{prs-SubframeOffset}$  otherwise.

If PRS is not transmitted:

This field indicates the uncertainty in *expectedRSTD* value. The uncertainty is related to the location server's a-priori estimation of the target device location. The *expectedRSTD* and *expectedRSTD-Uncertainty* together define the search window for the target device. The scale factor of the *expectedRSTD-Uncertainty* field is  $3 \times T_s$ , with  $T_s = 1 / (15000 \times 2048)$  seconds.

If  $T_x$  is the reception time of the beginning of the subframe  $X$  of the assistance data reference cell at the target device antenna connector, the target device may assume that the beginning of the closest subframe of this neighbour cell to subframe  $X$  is received within the search window of size  $[- \text{expectedRSTD-Uncertainty} \times 3 \times T_s, \text{expectedRSTD-Uncertainty} \times 3 \times T_s]$  centered at  $T_x + (\text{expectedRSTD} - 8192) \times 3 \times T_s$ .

**6.5.1.3 OTDOA Assistance Data Request****– OTDOA-RequestAssistanceData**

The IE *OTDOA-RequestAssistanceData* is used by the target device to request assistance data from a location server.

```
-- ASN1START
OTDOA-RequestAssistanceData ::= SEQUENCE {
    physCellId      INTEGER (0..503),
    ...
}
-- ASN1STOP
```

**OTDOA-RequestAssistanceData field descriptions****physCellId**

This field specifies the physical cell identity of the current primary cell of the target device.

**6.5.1.4 OTDOA Location Information****– OTDOA-ProvideLocationInformation**

The IE *OTDOA-ProvideLocationInformation* is used by the target device to provide OTDOA location measurements to the location server. It may also be used to provide OTDOA positioning specific error reason.

```
-- ASN1START
OTDOA-ProvideLocationInformation ::= SEQUENCE {
    otdoaSignalMeasurementInformation  OTDOA-SignalMeasurementInformation  OPTIONAL,
    otdoa-Error                        OTDOA-Error                        OPTIONAL,
    ...
}
-- ASN1STOP
```

## 6.5.1.5 OTDOA Location Information Elements

### – OTDOA-SignalMeasurementInformation

The IE *OTDOA-SignalMeasurementInformation* is used by the target device to provide RSTD measurements to the location server. The RSTD measurements are provided for a neighbour cell and the RSTD reference cell, both of which are provided in the IE *OTDOA-ProvideAssistanceData*. The RSTD reference cell may or may not be the same as the assistance data reference cell provided in *OTDOA-ReferenceCellInfo*. If the target device stops reporting inter-frequency RSTD measurements, where the inter-frequency RSTD measurement is an OTDOA RSTD measurement with at least one cell on a frequency different from the serving cell frequency, the LPP layer shall inform lower layers that inter-frequency RSTD measurements are stopped.

NOTE: If there are more than 24 *NeighbourMeasurementElement* to be sent, the target device may send them in multiple *ProvideLocationInformation* messages, as described under sub-clause 5.3.

```

Otherwise, the target device shall include this field if the EARFCN of this neighbour cell is not the same as the <i>earfcnRef</i> for the RSTD reference cell.                                     |
| <i>NotSameAsRef3</i> | The field is absent if the corresponding <i>earfcnNeighbour</i> is present. Otherwise, the target device shall include this field if the EARFCN of this neighbour cell is not the same as the <i>earfcnRef</i> for the RSTD reference cell.  |

#### OTDOA-SignalMeasurementInformation field descriptions

##### **systemFrameNumber**

This field specifies the SFN of the RSTD reference cell containing the starting subframe of the PRS positioning occasion if PRS are available on the RSTD reference cell, or subframe of the CRS for RSTD measurements if PRS are not available on the RSTD reference cell during which the most recent neighbour cell RSTD measurement was performed.

##### **physCellIdRef**

This field specifies the physical cell identity of the RSTD reference cell.

| <b>OTDOA-SignalMeasurementInformation field descriptions</b>  |
|---|
| <p><b>cellGlobalIdRef</b><br/>This field specifies the ECGI, the globally unique identity of a cell in E-UTRA, of the RSTD reference cell. The target shall provide this IE if it knows the ECGI of the RSTD reference cell.</p>  |
| <p><b>earfcnRef</b><br/>This field specifies the EARFCN of the RSTD reference cell.</p>   |
| <p><b>referenceQuality</b><br/>This field specifies the target device's best estimate of the quality of the TOA measurement from the RSTD reference cell, <math>T_{\text{SubframeRxRef}}</math>, where <math>T_{\text{SubframeRxRef}}</math> is the time of arrival of the signal from the RSTD reference cell.</p> |
| <p><b>neighbourMeasurementList</b><br/>This list contains the measured RSTD values for neighbour cells together with the RSTD reference cell, along with quality for each measurement.</p>  |
| <p><b>physCellIdNeighbour</b><br/>This field specifies the physical cell identity of the neighbour cell for which the RSTDs are provided.</p>   |
| <p><b>cellGlobalIdNeighbour</b><br/>This field specifies the ECGI, the globally unique identity of a cell in E-UTRA, of the neighbour cell for which the RSTDs are provided. The target device shall provide this IE if it was able to determine the ECGI of the neighbour cell at the time of measurement.</p>     |
| <p><b>earfcnNeighbour</b><br/>This field specifies the EARFCN of the neighbour cell used for the RSTD measurements.</p>   |
| <p><b>rstd</b><br/>This field specifies the relative timing difference between this neighbour cell and the RSTD reference cell, as defined in [17]. Mapping of the measured quantity is defined as in [18] subclause 9.1.10.3.</p>  |
| <p><b>rstd-Quality</b><br/>This field specifies the target device's best estimate of the quality of the measured <i>rstd</i>.</p>   |

## OTDOA-MeasQuality

```

-- ASN1START
OTDOA-MeasQuality ::= SEQUENCE {
    error-Resolution      BIT STRING (SIZE (2)),
    error-Value          BIT STRING (SIZE (5)),

| '00000'   | 0          | to (R*1-1) meters |                   |           |      |                   |         |            |                   |     |  |  |         |      |                 |
| '00001'   | R*1        | to (R*2-1) meters |                   |           |      |                   |         |            |                   |     |  |  |         |      |                 |
| '00010'   | R*2        | to (R*3-1) meters |                   |           |      |                   |         |            |                   |     |  |  |         |      |                 |
| ...   |            |                   |                   |           |      |                   |         |            |                   |     |  |  |         |      |                 |
| '11111'   | R*31       | meters or more;   |                   |           |      |                   |         |            |                   |     |  |  |         |      |                 |

**OTDOA-MeasQuality field descriptions****error-NumSamples**

If the *error-Value* field provides the sample uncertainty of the OTDOA (or TOA) measurement, this field specifies how many measurements have been used by the target device to determine this (i.e., sample size). Following 3 bit encoding is used:

|       |                         |
|-------|-------------------------|
| "000" | Not the baseline metric |
| '001' | 5-9                     |
| '010' | 10-14                   |
| '011' | 15-24                   |
| '100' | 25-34                   |
| '101' | 35-44                   |
| '110' | 45-54                   |
| '111' | 55 or more.             |

In case of the value "000", the *error-Value* field contains the target device's best estimate of the uncertainty of the OTDOA (or TOA) measurement not based on the baseline metric. E.g., other measurements such as signal-to-noise-ratio or signal strength can be utilized to estimate the *error-Value*.

If this field is absent, the value of this field is "000".

### 6.5.1.6 OTDOA Location Information Request

#### – OTDOA-RequestLocationInformation

The IE *OTDOA-RequestLocationInformation* is used by the location server to request OTDOA location measurements from a target device. Details of the required measurements (e.g. details of assistance data reference cell and neighbour cells) are conveyed in the *OTDOA-ProvideAssistanceData* IE in a separate Provide Assistance Data message.

```
-- ASN1START
OTDOA-RequestLocationInformation ::= SEQUENCE {
    assistanceAvailability    BOOLEAN,
    ...
}
-- ASN1STOP
```

**OTDOA-RequestLocationInformation field descriptions****assistanceAvailability**

This field indicates whether the target device may request additional OTDOA assistance data from the server. TRUE means allowed and FALSE means not allowed.

### 6.5.1.7 OTDOA Capability Information

#### – OTDOA-ProvideCapabilities

The IE *OTDOA-ProvideCapabilities* is used by the target device to indicate its capability to support OTDOA and to provide its OTDOA positioning capabilities to the location server.

```
-- ASN1START
OTDOA-ProvideCapabilities ::= SEQUENCE {
    otdoa-Mode    BIT STRING { ue-assisted (0) } (SIZE (1..8)),
    ...,
    supportedBandListEUTRA    SEQUENCE (SIZE (1..maxBands)) OF SupportedBandEUTRA    OPTIONAL,
    supportedBandListEUTRA-v9a0 SEQUENCE (SIZE (1..maxBands)) OF SupportedBandEUTRA-v9a0
    interFreqRSTDmeasurement-r10    ENUMERATED { supported }    OPTIONAL,
    additionalNeighbourCellInfoList-r10 ENUMERATED { supported }    OPTIONAL
}
maxBands INTEGER ::= 64
SupportedBandEUTRA ::= SEQUENCE {
    bandEUTRA    INTEGER (1..maxFBI)
}
```

```
SupportedBandEUTRA-v9a0 ::= SEQUENCE {
    bandEUTRA-v9a0
        INTEGER (maxFBI-Plus1..maxFBI2) OPTIONAL
}
maxFBI                INTEGER ::= 64 -- Maximum value of frequency band indicator
maxFBI-Plus1          INTEGER ::= 65 -- lowest value extended FBI range
maxFBI2                INTEGER ::= 256 -- highest value extended FBI range
-- ASN1STOP
```

#### OTDOA-ProvideCapabilities field descriptions

##### **interFreqRSTDmeasurement**

This field, if present, indicates that the target device supports inter-frequency RSTD measurements within and between the frequency bands indicated in *SupportedBandEUTRA*.

##### **otdoa-Mode**

This field specifies the OTDOA mode(s) supported by the target device. This is represented by a bit string, with a one-value at the bit position means the particular OTDOA mode is supported; a zero-value means not supported. A zero-value in all bit positions in the bit string means OTDOA positioning method is not supported by the target device.

##### **SupportedBandEUTRA**

This field specifies the frequency bands for which the target device supports RSTD measurements. One entry corresponding to each supported E-UTRA band as defined in TS 36.101 [21]. In case the target device includes *bandEUTRA-v9a0*, the target device shall set the corresponding entry of *bandEUTRA* (i.e. without suffix) to *maxFBI*.

##### **additionalNeighbourCellInfoList**

This field, if present, indicates that the target device supports up to 3x24 *OTDOA-NeighbourCellInfoElement* in *OTDOA-NeighbourCellInfoList* in *OTDOA-ProvideAssistanceData* without any restriction for the *earfcn* in each *OTDOA-NeighbourCellInfoElement* as specified in subclause 6.5.1.2.

### 6.5.1.8 OTDOA Capability Information Request

#### – OTDOA-RequestCapabilities

The IE *OTDOA-RequestCapabilities* is used by the location server to request the capability of the target device to support OTDOA and to request OTDOA positioning capabilities from a target device.

```
-- ASN1START
OTDOA-RequestCapabilities ::= SEQUENCE {
    ...
}
-- ASN1STOP
```

### 6.5.1.9 OTDOA Error Elements

#### – OTDOA-Error

The IE *OTDOA-Error* is used by the location server or target device to provide OTDOA error reasons to the target device or location server, respectively.

```
-- ASN1START
OTDOA-Error ::= CHOICE {
    locationServerErrorCauses    OTDOA-LocationServerErrorCauses,
    targetDeviceErrorCauses      OTDOA-TargetDeviceErrorCauses,
    ...
}
-- ASN1STOP
```

#### – OTDOA-LocationServerErrorCauses

The IE *OTDOA-LocationServerErrorCauses* is used by the location server to provide OTDOA error reasons to the target device.

```

-- ASN1START
OTDOA-LocationServerErrorCauses ::= SEQUENCE {
  cause      ENUMERATED { undefined,
                          assistanceDataNotSupportedByServer,
                          assistanceDataSupportedButCurrentlyNotAvailableByServer,
                          ...
                        },
  ...
}
-- ASN1STOP

```

## – OTDOA-TargetDeviceErrorCauses

The IE *OTDOA-TargetDeviceErrorCauses* is used by the target device to provide OTDOA error reasons to the location server.

```

-- ASN1START
OTDOA-TargetDeviceErrorCauses ::= SEQUENCE {
  cause      ENUMERATED { undefined,
                          assistance-data-missing,
                          unableToMeasureReferenceCell,
                          unableToMeasureAnyNeighbourCell,
                          attemptedButUnableToMeasureSomeNeighbourCells,
                          ...
                        },
  ...
}
-- ASN1STOP

```

## 6.5.2 A-GNSS Positioning

### 6.5.2.1 GNSS Assistance Data

#### – A-GNSS-ProvideAssistanceData

The IE *A-GNSS-ProvideAssistanceData* is used by the location server to provide assistance data to enable UE-based and UE-assisted A-GNSS. It may also be used to provide GNSS positioning specific error reasons.

```

-- ASN1START
A-GNSS-ProvideAssistanceData ::= SEQUENCE {
  gnss-CommonAssistData      GNSS-CommonAssistData      OPTIONAL, -- Need ON
  gnss-GenericAssistData     GNSS-GenericAssistData     OPTIONAL, -- Need ON
  gnss-Error                 A-GNSS-Error              OPTIONAL, -- Need ON
  ...
}
-- ASN1STOP

```

#### – GNSS-CommonAssistData

The IE *GNSS-CommonAssistData* is used by the location server to provide assistance data which can be used for any GNSS (e.g., GPS, Galileo, GLONASS, BDS, etc.).

```

-- ASN1START
GNSS-CommonAssistData ::= SEQUENCE {
  gnss-ReferenceTime      GNSS-ReferenceTime      OPTIONAL, -- Need ON
  gnss-ReferenceLocation  GNSS-ReferenceLocation  OPTIONAL, -- Need ON
  gnss-IonosphericModel   GNSS-IonosphericModel   OPTIONAL, -- Need ON
  gnss-EarthOrientationParameters GNSS-EarthOrientationParameters OPTIONAL, -- Need ON
  ...
}

```

```
-- ASN1STOP
```

## GNSS-GenericAssistData

The IE *GNSS-GenericAssistData* is used by the location server to provide assistance data for a specific GNSS (e.g., GPS, Galileo, GLONASS, BDS, etc.). The specific GNSS for which the provided assistance data are applicable is indicated by the IE *GNSS-ID* and (if applicable) by the IE *SBAS-ID*. Assistance for up to 16 GNSSs can be provided.

```
-- ASN1START
```

```
GNSS-GenericAssistData ::= SEQUENCE (SIZE (1..16)) OF GNSS-GenericAssistDataElement
GNSS-GenericAssistDataElement ::= SEQUENCE {
  gnss-ID                GNSS-ID,
  sbas-ID                SBAS-ID                OPTIONAL, -- Cond GNSS-ID-SBAS
  gnss-TimeModels        GNSS-TimeModelList    OPTIONAL, -- Need ON
  gnss-DifferentialCorrections GNSS-DifferentialCorrections OPTIONAL, -- Need ON
  gnss-NavigationModel   GNSS-NavigationModel  OPTIONAL, -- Need ON
  gnss-RealTimeIntegrity GNSS-RealTimeIntegrity                    OPTIONAL, -- Need ON
  gnss-DataBitAssistance GNSS-DataBitAssistance                OPTIONAL, -- Need ON
  gnss-AcquisitionAssistance GNSS-AcquisitionAssistance                OPTIONAL, -- Need ON
  gnss-Almanac           GNSS-Almanac           OPTIONAL, -- Need ON
  gnss-UTC-Model         GNSS-UTC-Model         OPTIONAL, -- Need ON
  gnss-AuxiliaryInformation GNSS-AuxiliaryInformation                OPTIONAL, -- Need ON
  ...,
  [[
    bds-DifferentialCorrections-r12
                                BDS-DifferentialCorrections-r12 OPTIONAL, -- Cond GNSS-ID-BDS
    bds-GridModel-r12           BDS-GridModelParameter-r12    OPTIONAL, -- Cond GNSS-ID-BDS
  ]]
}
```

```
-- ASN1STOP
```

| Conditional presence | Explanation   |
|----------------------|---|
| <i>GNSS-ID-SBAS</i>  | The field is mandatory present if the <i>GNSS-ID</i> = <i>sbas</i> ; otherwise it is not present. |
| <i>GNSS-ID-BDS</i>   | The field may be present if the <i>GNSS-ID</i> = <i>bds</i> ; otherwise it is not present.        |

### 6.5.2.2 GNSS Assistance Data Elements

#### GNSS-ReferenceTime

The IE *GNSS-ReferenceTime* is used by the location server to provide the GNSS specific system time with uncertainty and the relationship between GNSS system time and network air-interface timing of the eNodeB/NodeB/BTS transmission in the reference cell.

If the IE *networkTime* is present, the IEs *gnss-SystemTime* and *networkTime* provide a valid relationship between GNSS system time and air-interface network time, as seen at the approximate location of the target device, i.e. the propagation delay from the the eNodeB/NodeB/BTS to the target device shall be compensated for by the location server. Depending on implementation, the relation between GNSS system time and air-interface network time may have varying accuracy. The uncertainty of this timing relation is provided in the IE *referenceTimeUnc*. If the propagation delay from the eNodeB/NodeB/BTS to the target device is not accurately known, the location server shall use the best available approximation of the propagation delay and take the corresponding delay uncertainty into account in the calculation of the IE *referenceTimeUnc*.

If the IE *networkTime* is not present, the IE *gnssSystemTime* is an estimate of current GNSS system time at time of reception of the IE *GNSS-ReferenceTime* by the target device. The location server should achieve an accuracy of +/- 3 seconds for this estimate including allowing for the transmission delay between the location server and the target device. Note that the target device should further compensate *gnss-SystemTime* for the time between the reception of *GNSS-ReferenceTime* and the time when the *gnss-SystemTime* is used.

The location server shall provide a value for the *gnss-TimeID* only for GNSSs supported by the target device.

The IE *GNSS-ReferenceTimeForOneCell* can be provided multiple times (up to 16) to provide fine time assistance for several (neighbour) cells.

```
-- ASN1START
GNSS-ReferenceTime ::= SEQUENCE {
  gnss-SystemTime      GNSS-SystemTime,
  referenceTimeUnc     INTEGER (0..127)          OPTIONAL,  -- Cond noFTA
  gnss-ReferenceTimeForCells SEQUENCE (SIZE (1..16)) OF
                        GNSS-ReferenceTimeForOneCell  OPTIONAL,  -- Need ON
  ...
}

GNSS-ReferenceTimeForOneCell ::= SEQUENCE {
  networkTime          NetworkTime,
  referenceTimeUnc     INTEGER (0..127),

}
-- ASN1STOP
```

| Conditional presence | Explanation   |
|----------------------|---|
| <i>noFTA</i>         | The field may be present if <i>gnss-ReferenceTimeForCells</i> is absent; otherwise it is not present. |

| <b>GNSS-ReferenceTime field descriptions</b> |  |
|--|--|
| <b><i>gnss-SystemTime</i></b>                | This field provides the specific GNSS system time.   |
| <b><i>networkTime</i></b>                    | This field specifies the cellular network time at the epoch corresponding to <i>gnss-SystemTime</i> .  |
| <b><i>referenceTimeUnc</i></b>               | <p>This field provides the accuracy of the relation between <i>gnssSystemTime</i> and <i>networkTime</i> time if IE <i>networkTime</i> is provided. When IE <i>networkTime</i> is not provided, this field can be included to provide the accuracy of the provided <i>gnssSystemTime</i>.</p> <p>If GNSS TOD is the given GNSS time, then the true GNSS time, corresponding to the provided network time as observed at the target device location, lies in the interval [GNSS TOD - <i>referenceTimeUnc</i>, GNSS TOD + <i>referenceTimeUnc</i>].</p> <p>The uncertainty <i>r</i>, expressed in microseconds, is mapped to a number <i>K</i>, with the following formula:</p> $r = C * ((1+x)^K) - 1$ <p>with C = 0.5 and x = 0.14. To encode any higher value of uncertainty than that corresponding in the above formula to K=127, the same value, K=127, shall also be used. The uncertainty is then coded on 7 bits, as the binary encoding of K. Example values for the <i>referenceTimeUnc</i> Format: see table K to uncertainty relation below.</p> |
| <b><i>bsAlign</i></b>                        | <p>This flag, if present, indicates that the transmission timings of all cells sharing, depending on the RAT, the same carrier frequency and Tracking Area/Location Area/Routing Area as the cell indicated, are frame aligned. This information allows the target device to derive the GNSS - cellular time relation for any of these cells based on the timing relation information provided in GNSS-ReferenceTime. The flag should be set consistently in all these cells. This flag does not guarantee SFN alignment.</p>  |

**K to uncertainty relation**

| Value of K | Value of uncertainty |
|------------|----------------------|
| 0          | 0 nanoseconds        |
| 1          | 70 nanoseconds       |
| 2          | 149.8 nanoseconds    |
| -          | -                    |
| 50         | 349.62 microseconds  |
| -          | -                    |
| 127        | ≥ 8.43 seconds       |

– GNSS-SystemTime

```
-- ASN1START
```

```

GNSS-SystemTime ::= SEQUENCE {
    gnss-TimeID          GNSS-ID,
    gnss-DayNumber       INTEGER (0..32767),
    gnss-TimeOfDay       INTEGER (0..86399),
    gnss-TimeOfDayFrac-msec  INTEGER (0..999)    OPTIONAL, -- Need ON
    notificationOfLeapSecond BIT STRING (SIZE(2)) OPTIONAL, -- Cond gnss-TimeID-glonass
    gps-TOW-Assist       GPS-TOW-Assist    OPTIONAL, -- Cond gnss-TimeID-gps
    ...
}
-- ASN1STOP

```

| Conditional presence       | Explanation   |
|----------------------------|---|
| <i>gnss-TimeID-glonass</i> | The field may be present if <i>gnss-TimeID</i> =`glonass`; otherwise it is not present. |
| <i>gnss-TimeID-gps</i>     | The field may be present if <i>gnss-TimeID</i> =`gps`; otherwise it is not present.     |

| <b>GNSS-SystemTime field descriptions</b> |  |
|---|--|
| <b><i>gnss-TimeID</i></b>                 | This field specifies the GNSS for which the <i>GNSS-SystemTime</i> is provided.  |
| <b><i>gnss-DayNumber</i></b>              | This field specifies the sequential number of days (with day count starting at 0) from the origin of the GNSS System Time as follows:<br>GPS, QZSS, SBAS – Days from January 6 <sup>th</sup> 1980 00:00:00 UTC (USNO);<br>Galileo – Days from August 22nd 1999 00:00 UT;<br>GLONASS – Days from January 1 <sup>st</sup> 1996 03:00:00 UTC (RU);<br>BDS – Days from January 1st 2006 00:00:00 UTC (NTSC). |
| <b><i>gnss-TimeOfDay</i></b>              | This field specifies the integer number of seconds from the GNSS day change.   |
| <b><i>gnss-TimeOfDayFrac-msec</i></b>     | This field specifies the fractional part of the <i>gnssTimeOfDay</i> field in 1-milli-seconds resolution. The total GNSS TOD is <i>gnss-TimeOfDay</i> + <i>gnssTimeOfDayFrac-msec</i> .  |
| <b><i>notificationOfLeapSecond</i></b>    | This field specifies the notification of forthcoming leap second correction, as defined by parameter KP in [9, Table 4.7].   |
| <b><i>gps-TOW-Assist</i></b>              | This field contains several fields in the Telemetry (TLM) Word and Handover Word (HOW) that are currently being broadcast by the respective GPS satellites. Combining this information with GPS TOW enables the target device to know the entire 1.2-second (60-bit) pattern of TLM and HOW that is transmitted at the start of each six-second NAV subframe by the particular GPS satellite.            |

## – GPS-TOW-Assist

```

-- ASN1START
GPS-TOW-Assist ::= SEQUENCE (SIZE(1..64)) OF GPS-TOW-AssistElement
GPS-TOW-AssistElement ::= SEQUENCE {

        },
        ...
    },
    ...
}
-- ASN1STOP

```

| <b>Conditional presence</b> | <b>Explanation</b>   |
|-----------------------------|--|
| <i>EARFCN-max</i>           | The field is mandatory present if the corresponding <i>earfcn</i> (i.e. without suffix) is set to <i>maxEARFCN</i> . Otherwise the field is not present. |
| <i>GNSSsynch</i>            | The field is present and set to 0 if <i>NetworkTime</i> is synchronized to <i>gnss-SystemTime</i> ; otherwise the field is optionally present, need OR.  |

| <b>NetworkTime field descriptions</b>  |
|--|
| <p><b>secondsFromFrameStructureStart</b><br/>This field specifies the number of seconds from the beginning of the longest frame structure in the corresponding air interface.<br/>In case of E-UTRA, the SFN cycle length is 10.24 seconds.<br/>In case of UTRA, the SFN cycle length is 40.96 seconds.<br/>In case of GSM, the hyperframe length is 12533.76 seconds.</p> |
| <p><b>fractionalSecondsFromFrameStructureStart</b><br/>This field specifies the fractional part of the <i>secondsFromFrameStructureStart</i> in 250 ns resolution.<br/>The total time since the particular frame structure start is <i>secondsFromFrameStructureStart</i> + <i>fractionalSecondsFromFrameStructureStart</i></p>  |

|   |
|---|
| <b>frameDrift</b>   |
| This field specifies the drift rate of the GNSS-network time relation with scale factor $2^{-30}$ seconds/second, in the range from $-5.9605e-8$ to $+5.8673e-8$ sec/sec.   |
| <b>cellID</b>   |
| This field specifies the cell for which the GNSS-network time relation is provided.   |
| <b>physCellId</b>   |
| This field specifies the physical cell identity of the reference cell (E-UTRA), as defined in [12], for which the GNSS network time relation is provided.   |
| <b>cellGlobalIdEUTRA</b>  |
| This field specifies the Evolved Cell Global Identifier (ECGI), the globally unique identity of a cell in E-UTRA, of the reference cell for the GNSS-network time relation, as defined in [12].   |
| <b>earfcn</b>   |
| This field specifies E-ARFCN of the reference cell for the GNSS-network time relation (E-UTRA). In case the server includes <i>earfcn-v9a0</i> , the server shall set the corresponding <i>earfcn</i> (i.e. without suffix) to <i>maxEARFCN</i> . |
| <b>primary-CPICH-Info</b>   |
| This field specifies the physical cell identity of the reference cell (UTRA) for the GNSS-network time relation, as defined in [13].  |
| <b>cellParameters</b>   |
| This field specifies the physical cell identity of the reference cell (UTRA) for the GNSS-network time relation, as defined in [13].  |
| <b>cellGlobalIdUTRA</b>   |
| The field specifies the global UTRAN Cell Identifier, the globally unique identity of a cell in UTRA, of the reference cell for the GNSS-network time relation, as defined in [13].   |
| <b>uarfcn</b>   |
| This field specifies ARFCN of the reference cell for the GNSS-network time relation (UTRA).   |
| <b>bcchCarrier</b>  |
| This field specifies the absolute GSM RF channel number of the BCCH of the reference base station (GERAN) for the GNSS-network time relation, as defined in [14].   |
| <b>bsic</b>   |
| This field specifies the Base Station Identity Code of the reference base station (GERAN) for the GNSS-network time relation, as defined in [14].   |
| <b>cellGlobalIdGERAN</b>  |
| This field specifies the Cell Global Identification (CGI), the globally unique identity of a cell in GERAN, of the reference base station for the GNSS-network time relation.   |

## – GNSS-ReferenceLocation

The IE *GNSS-ReferenceLocation* is used by the location server to provide the target device with a-priori knowledge of its location in order to improve GNSS receiver performance. The IE *GNSS-ReferenceLocation* is provided in WGS-84 reference system.

```
-- ASN1START
GNSS-ReferenceLocation ::= SEQUENCE {
    threeDlocation      EllipsoidPointWithAltitudeAndUncertaintyEllipsoid,
    ...
}
-- ASN1STOP
```

## – GNSS-IonosphericModel

The IE *GNSS-IonosphericModel* is used by the location server to provide parameters to model the propagation delay of the GNSS signals through the ionosphere. Proper use of these fields allows a single-frequency GNSS receiver to remove parts of the ionospheric delay from the pseudorange measurements. Two Ionospheric Models are supported: The Klobuchar model as defined in [4], and the NeQuick model as defined in [8].

```
-- ASN1START
GNSS-IonosphericModel ::= SEQUENCE {
    klobucharModel      KlobucharModelParameter      OPTIONAL,  -- Need ON
    neQuickModel        NeQuickModelParameter        OPTIONAL,  -- Need ON
    ...
}
-- ASN1STOP
```

## KlobucharModelParameter

```

-- ASN1START
KlobucharModelParameter ::= SEQUENCE {
    dataID          BIT STRING (SIZE (2)),
    alfa0           INTEGER (-128..127),
    alfa1           INTEGER (-128..127),
    alfa2           INTEGER (-128..127),
    alfa3           INTEGER (-128..127),
    beta0           INTEGER (-128..127),
    beta1           INTEGER (-128..127),
    beta2           INTEGER (-128..127),
    beta3           INTEGER (-128..127),
    ...
}
-- ASN1STOP

```

### KlobucharModelParameter field descriptions

|  |
|--|
| <p><b>dataID</b></p> <p>When <i>dataID</i> has the value "11" it indicates that the parameters have been generated by QZSS, and the parameters have been specialized and are applicable within the area defined in [7]. When <i>dataID</i> has the value "01" it indicates that the parameters have been generated by BDS, and UE shall use these parameters according to the description given in 5.2.4.7 in [23]. When <i>dataID</i> has the value "00" it indicates the parameters are applicable worldwide [4,7]. All other values for <i>dataID</i> are reserved.</p> |
| <p><b>alpha0</b></p> <p>This field specifies the <math>\alpha_0</math> parameter of the Klobuchar model, as specified in [4], [23].<br/>Scale factor <math>2^{-30}</math> seconds.</p>   |

## NeQuickModelParameter

```

-- ASN1START
NeQuickModelParameter ::= SEQUENCE {
    ai0             INTEGER (0..2047),
    ai1             INTEGER (-1024..1023),
    ai2             INTEGER (-8192..8191),
    ionoStormFlag1 INTEGER (0..1)      OPTIONAL, -- Need OP
    ionoStormFlag2 INTEGER (0..1)      OPTIONAL, -- Need OP
    ionoStormFlag3 INTEGER (0..1)      OPTIONAL, -- Need OP
    ionoStormFlag4 INTEGER (0..1)      OPTIONAL, -- Need OP
    ionoStormFlag5 INTEGER (0..1)      OPTIONAL, -- Need OP
    ...
}

```

```
-- ASN1STOP
```

#### **NeQuickModelParameter field descriptions**

|   |
|---|
| <p><b>ai0</b><br/>Effective Ionisation Level 1<sup>st</sup> order parameter.<br/>Scale factor 2<sup>-2</sup> Solar Flux Units (SFUs), [8] section 5.1.6.</p>  |
| <p><b>ai1</b><br/>Effective Ionisation Level 2<sup>nd</sup> order parameter.<br/>Scale factor 2<sup>-8</sup> Solar Flux Units/degree, [8] section 5.1.6.</p>  |
| <p><b>ai2</b><br/>Effective Ionisation Level 3<sup>rd</sup> order parameter.<br/>Scale factor 2<sup>-15</sup> Solar Flux Units/degree<sup>2</sup>, [8] section 5.1.6.</p>   |
| <p><b>ionoStormFlag1, ionoStormFlag2, ionoStormFlag3, ionoStormFlag4, ionoStormFlag5</b><br/>These fields specify the ionosphere disturbance flags (1,...,5) for five different regions as described in [8], section 5.1.6. If the ionosphere disturbance flag for a region is not present the target device shall treat the ionosphere disturbance condition as unknown.</p> |

### GNSS-EarthOrientationParameters

The IE *GNSS-EarthOrientationParameters* is used by the location server to provide parameters to construct the ECEF and ECI coordinate transformation as defined in [4]. The IE *GNSS-EarthOrientationParameters* indicates the relationship between the Earth's rotational axis and WGS-84 reference system.

```
-- ASN1START

GNSS-EarthOrientationParameters ::= SEQUENCE {
    teop                INTEGER (0..65535),
    pmX                 INTEGER (-1048576..1048575),
    pmXdots             INTEGER (-16384..16383),
    pmY                 INTEGER (-1048576..1048575),
    pmYdots             INTEGER (-16384..16383),
    deltaUT1            INTEGER (-1073741824..1073741823),
    deltaUT1dots       INTEGER (-262144..262143),
    ...
}

-- ASN1STOP
```

#### **GNSS-EarthOrientationParameters field descriptions**

|   |
|---|
| <p><b>teop</b><br/>This field specifies the EOP data reference time in seconds, as specified in [4].<br/>Scale factor 2<sup>4</sup> seconds.</p>  |
| <p><b>pmX</b><br/>This field specifies the X-axis polar motion value at reference time in arc-seconds, as specified in [4].<br/>Scale factor 2<sup>-20</sup> arc-seconds.</p>             |
| <p><b>pmXdots</b><br/>This field specifies the X-axis polar motion drift at reference time in arc-seconds/day, as specified in [4].<br/>Scale factor 2<sup>-21</sup> arc-seconds/day.</p> |
| <p><b>pmY</b><br/>This field specifies the Y-axis polar motion value at reference time in arc-seconds, as specified in [4].<br/>Scale factor 2<sup>-20</sup> arc-seconds.</p>             |
| <p><b>pmYdots</b><br/>This field specifies the Y-axis polar motion drift at reference time in arc-seconds/day, as specified in [4].<br/>Scale factor 2<sup>-21</sup> arc-seconds/day.</p> |
| <p><b>deltaUT1</b><br/>This field specifies the UT1-UTC difference at reference time in seconds, as specified in [4].<br/>Scale factor 2<sup>-24</sup> seconds.</p>                       |
| <p><b>deltaUT1dots</b><br/>This field specifies the Rate of UT1-UTC difference at reference time in seconds/day, as specified in [4].<br/>Scale factor 2<sup>-25</sup> seconds/day.</p>   |

– GNSS-TimeModelList

The IE *GNSS-TimeModelList* is used by the location server to provide the GNSS-GNSS system time offset between the GNSS system time indicated by IE *GNSS-ID* in IE *GNSS-GenericAssistDataElement* to the GNSS system time indicated by IE *gnss-TO-ID*. Several *GNSS-TimeModelElement* IEs can be included with different *gnss-TO-ID* fields.

```
-- ASN1START
GNSS-TimeModelList ::= SEQUENCE (SIZE (1..15)) OF GNSS-TimeModelElement
GNSS-TimeModelElement ::= SEQUENCE {
  gnss-TimeModelRefTime    INTEGER (0..65535),
  tA0                      INTEGER (-67108864..67108863),
  tA1                      INTEGER (-4096..4095)                OPTIONAL, -- Need ON
  tA2                      INTEGER (-64..63)                    OPTIONAL, -- Need ON
  gnss-TO-ID               INTEGER (1..15),
  weekNumber               INTEGER (0..8191)                   OPTIONAL, -- Need ON
  deltaT                   INTEGER (-128..127)                 OPTIONAL, -- Need ON
  ...
}
-- ASN1STOP
```

**GNSS-TimeModelElement field descriptions**

– GNSS-DifferentialCorrections

The IE *GNSS-DifferentialCorrections* is used by the location server to provide differential GNSS corrections to the target device for a specific GNSS. Differential corrections can be provided for up to 3 signals per GNSS.

```

#### **GNSS-DifferentialCorrections field descriptions**

##### ***dgnss-RefTime***

This field specifies the time for which the DGNSS corrections are valid, modulo 1 hour. *dgnss-RefTime* is given in GNSS specific system time.

Scale factor 1-second.

##### ***dgnss-SgnTypeList***

This list includes differential correction data for different GNSS signal types, identified by *GNSS-SignalID*.

##### ***gnss-StatusHealth***

This field specifies the status of the differential corrections. The values of this field and their respective meanings are defined as in table *gnss-StatusHealth* Value to Indication relation below.

The first six values in this field indicate valid differential corrections. When using the values described below, the "UDRE Scale Factor" value is applied to the UDRE values contained in the element. The purpose is to indicate an estimate in the amount of error in the corrections.

The value "110" indicates that the source of the differential corrections (e.g., reference station or external DGNSS network) is currently not being monitored. The value "111" indicates that the corrections provided by the source are invalid, as judged by the source.

##### ***dgnss-SatList***

This list includes differential correction data for different GNSS satellites, identified by *SV-ID*.

##### ***iod***

This field specifies the Issue of Data field which contains the identity for the *GNSS-NavigationModel*.

##### ***udre***

This field provides an estimate of the uncertainty ( $1-\sigma$ ) in the corrections for the particular satellite. The value in this field shall be multiplied by the UDRE Scale Factor in the *gnss-StatusHealth* field to determine the final UDRE estimate for the particular satellite. The meanings of the values for this field are shown in the table *udre* Value to Indication relation below.

| <b>GNSS-DifferentialCorrections field descriptions</b>   |  |
|--|--|
| <p><b>pseudoRangeCor</b><br/>                     This field specifies the correction to the pseudorange for the particular satellite at <i>dgnss-RefTime</i>, <math>t_0</math>. The value of this field is given in meters and the scale factor is 0.32 meters in the range of <math>\pm 655.04</math> meters. The method of calculating this field is described in [11].<br/>                     If the location server has received a request for GNSS assistance data from a target device which included a request for the GNSS Navigation Model and DGNSS, the location server shall determine, for each satellite, if the navigation model stored by the target device is still suitable for use with DGNSS corrections and if so and if DGNSS corrections are supported the location server should send DGNSS corrections without including the GNSS Navigation Model. The <i>iod</i> value sent for a satellite shall always be the IOD value that corresponds to the navigation model for which the pseudo-range corrections are applicable.<br/>                     The target device shall only use the <i>pseudoRangeCor</i> value when the IOD value received matches its available navigation model.<br/>                     Pseudo-range corrections are provided with respect to GNSS specific geodetic datum (e.g., PZ-90.02 if <i>GNSS-ID</i> indicates GLONASS).<br/>                     Scale factor 0.32 meters.</p> |  |
| <p><b>rangeRateCor</b><br/>                     This field specifies the rate-of-change of the pseudorange correction for the particular satellite, using the satellite ephemeris and clock corrections identified by the <i>iod</i> field. The value of this field is given in meters per second and the resolution is 0.032 meters/sec in the range of <math>\pm 4.064</math> meters/sec. For some time <math>t_1 &gt; t_0</math>, the corrections for <i>iod</i> are estimated by<br/> <math display="block">PRC(t_1, IOD) = PRC(t_0, IOD) + RRC(t_0, IOD) \cdot (t_1 - t_0)</math>                     , and the target device uses this to correct the pseudorange it measures at <math>t_1</math>, <math>PR_m(t_1, IOD)</math>, by<br/> <math display="block">PR(t_1, IOD) = PR_m(t_1, IOD) + PRC(t_1, IOD)</math>                     .<br/>                     The location server shall always send the RRC value that corresponds to the PRC value that it sends. The target device shall only use the RRC value when the <i>iod</i> value received matches its available navigation model.<br/>                     Scale factor 0.032 meters/second.</p>  |  |
| <p><b>udreGrowthRate</b><br/>                     This field provides an estimate of the growth rate of uncertainty (1-<math>\sigma</math>) in the corrections for the particular satellite identified by <i>SV-ID</i>. The estimated UDRE at time value specified in the <i>udreValidityTime</i> <math>t_1</math> is calculated as follows:<br/> <math display="block">UDRE(t_0+t_1) = UDRE(t_0) \times udreGrowthRate</math>                     , where <math>t_0</math> is the DGNSS Reference Time <i>dgnss-RefTime</i> for which the corrections are valid, <math>t_1</math> is the <i>udreValidityTime</i> field, <math>UDRE(t_0)</math> is the value of the <i>udre</i> field, and <i>udreGrowthRate</i> field is the factor as shown in the table Value of <i>udreGrowthRate</i> to Indication relation below.</p>  |  |
| <p><b>udreValidityTime</b><br/>                     This field specifies the time when the <i>udreGrowthRate</i> field applies and is included if <i>udreGrowthRate</i> is included. The meaning of the values for this field is as shown in the table Value of <i>udreValidityTime</i> to Indication relation below.</p>  |  |

**gnss-StatusHealth Value to Indication relation**

## – GNSS-NavigationModel

The IE *GNSS-NavigationModel* is used by the location server to provide precise navigation data to the GNSS capable target device. In response to a request from a target device for GNSS Assistance Data, the location server shall determine whether to send the navigation model for a particular satellite to a target device based upon factors like the T-Toe limit specified by the target device and any request from the target device for DGNSS (see also *GNSS-DifferentialCorrections*). GNSS Orbit Model can be given in Keplerian parameters or as state vector in Earth-Centered Earth-Fixed coordinates, dependent on the *GNSS-ID* and the target device capabilities. The meaning of these parameters is defined in relevant ICDs of the particular GNSS and GNSS specific interpretations apply. For example, GPS and QZSS use the same model parameters but some parameters have a different interpretation [7].

## StandardClockModelList field descriptions

|   |
|---|
| <p><b>standardClockModelList</b><br/> <i>gnss-ClockModel</i> Model-1 contains one or two clock model elements. If included, clock Model-1 shall be included once or twice depending on the target device capability.<br/>           If the target device is supporting multiple Galileo signals, the location server shall include both F/Nav and I/Nav clock models in <i>gnss-ClockModel</i> if the location server assumes the target device to perform location information calculation using multiple signals.</p> |
| <p><b>stanClockToc</b><br/>           Parameter <math>t_{oc}</math> defined in [8].<br/>           Scale factor 60 seconds.</p>   |
| <p><b>stanClockAF2</b><br/>           Parameter <math>af_2</math> defined in [8].<br/>           Scale factor <math>2^{-59}</math> seconds/second<sup>2</sup>.</p>  |
| <p><b>stanClockAF1</b><br/>           Parameter <math>af_1</math> defined in [8].<br/>           Scale factor <math>2^{-46}</math> seconds/second.</p>  |
| <p><b>stanClockAF0</b><br/>           Parameter <math>af_0</math> defined in [8].<br/>           Scale factor <math>2^{-34}</math> seconds.</p>   |
| <p><b>stanClockTgd</b><br/>           Parameter <math>T_{GD}</math>, Broadcast Group Delay (BGD), defined in [8].<br/>           Scale factor <math>2^{-32}</math> seconds.<br/>           This field is required if the target device supports only single frequency Galileo signal.</p>   |

**StandardClockModelList field descriptions****stanModelID**

This field specifies the identity of the clock model according to the table Value of stanModelID to Identity relation below. This field is required if the location server includes both F/Nav and I/Nav Galileo clock models in *gnss-ClockModel*.

**Value of stanModelID to Identity relation**

| Value of <i>stanModelID</i> | Identity |
|-----------------------------|----------|
| 0                           | I/Nav    |
| 1                           | F/Nav    |

**NAV-ClockModel**

```
-- ASN1START
NAV-ClockModel ::= SEQUENCE {
    navToc          INTEGER (0..37799),
    navaf2          INTEGER (-128..127),
    navaf1          INTEGER (-32768..32767),
    navaf0          INTEGER (-2097152..2097151),
    navTgd          INTEGER (-128..127),
    ...
}
-- ASN1STOP
```

**NAV-ClockModel field descriptions****navToc**

Parameter  $t_{oc}$ , time of clock (seconds) [4,7]  
Scale factor  $2^4$  seconds.

**navaf2**

Parameter  $a_{f2}$ , clock correction polynomial coefficient (sec/sec<sup>2</sup>) [4,7].  
Scale factor  $2^{55}$  seconds/second<sup>2</sup>.

**navaf1**

Parameter  $a_{f1}$ , clock correction polynomial coefficient (sec/sec) [4,7].  
Scale factor  $2^{43}$  seconds/second.

**navaf0**

Parameter  $a_{f0}$ , clock correction polynomial coefficient (seconds) [4,7].  
Scale factor  $2^{31}$  seconds.

**navTgd**

Parameter  $T_{GD}$ , group delay (seconds) [4,7].  
Scale factor  $2^{31}$  seconds.

## – GNSS-RealTimeIntegrity

The IE *GNSS-RealTimeIntegrity* is used by the location server to provide parameters that describe the real-time status of the GNSS constellations. *GNSS-RealTimeIntegrity* data communicates the health of the GNSS signals to the mobile in real-time.

The location server shall always transmit the *GNSS-RealTimeIntegrity* with the current list of unhealthy signals (i.e., not only for signals/SVs currently visible at the reference location), for any GNSS positioning attempt and whenever GNSS assistance data are sent. If the number of bad signals is zero, then the *GNSS-RealTimeIntegrity* IE shall be omitted.

-- ASN1START

```

GNSS-RealTimeIntegrity ::= SEQUENCE {
    gnss-BadSignalList  GNSS-BadSignalList,
    ...
}

GNSS-BadSignalList ::= SEQUENCE (SIZE(1..64)) OF BadSignalElement

BadSignalElement ::= SEQUENCE {
    badSVID              SV-ID,
    badSignalID         GNSS-SignalIDs  OPTIONAL,  -- Need OP
    ...
}

-- ASN1STOP

```

#### **GNSS-RealTimeIntegrity field descriptions**

##### **gnss-BadSignalList**

This field specifies a list of satellites with bad signal or signals.

##### **badSVID**

This field specifies the GNSS *SV-ID* of the satellite with bad signal or signals.

##### **badSignalID**

This field identifies the bad signal or signals of a satellite. This is represented by a bit string in *GNSS-SignalIDs*, with a one-value at a bit position means the particular GNSS signal type of the SV is unhealthy; a zero-value means healthy. Absence of this field means that all signals on the specific SV are bad.

## – GNSS-DataBitAssistance

The IE *GNSS-DataBitAssistance* is used by the location server to provide data bit assistance data for specific satellite signals for data wipe-off. The data bits included in the assistance data depends on the GNSS and its signal.

```

-- ASN1START

GNSS-DataBitAssistance ::= SEQUENCE {
    gnss-TOD              INTEGER (0..3599),
    gnss-TODfrac         INTEGER (0..999)  OPTIONAL,  -- Need ON
    gnss-DataBitsSatList GNSS-DataBitsSatList,

    ...
}

-- ASN1STOP

```

#### **GNSS-DataBitAssistance field descriptions**

##### **gnss-TOD**

This field specifies the reference time of the first bit of the data in *GNSS-DataBitAssistance* in integer seconds in GNSS specific system time, modulo 1 hour.  
Scale factor 1 second.

##### **gnss-TODfrac**

This field specifies the fractional part of the *gnss-TOD* in 1-milli-second resolution.  
Scale factor 1 millisecond. The total GNSS TOD is *gnss-TOD* + *gnss-TODfrac*.

##### **gnss-DataBitsSatList**

This list specifies the data bits for a particular GNSS satellite *SV-ID* and signal *GNSS-SignalID*.

In case of QZSS QZS-L5, it contains the encoded modulation symbols as defined in [7] section 5.6.</p> <p>In case of GLONASS, it contains the 100 sps differentially Manchester encoded modulation symbols as defined in [9] section 3.3.2.2.</p> <p>In case of Galileo, it contains the FEC encoded and interleaved modulation symbols. The logical levels 1 and 0 correspond to signal levels -1 and +1, respectively.</p> <p>In case of BDS, it contains the encoded and interleaved modulation symbols as defined in [23, section 5.1.3].</p> |

## – GNSS-AcquisitionAssistance

The IE *GNSS-AcquisitionAssistance* is used by the location server to provide parameters that enable fast acquisition of the GNSS signals. Essentially, these parameters describe the range and derivatives from respective satellites to the reference location at the reference time *GNSS-SystemTime* provided in IE *GNSS-ReferenceTime*.

Whenever *GNSS-AcquisitionAssistance* is provided by the location server, the IE *GNSS-ReferenceTime* shall be provided as well. E.g., even if the target device request for assistance data includes only a request for *GNSS-AcquisitionAssistance*, the location server shall also provide the corresponding IE *GNSS-ReferenceTime*.

Figure 6.5.2.2-1 illustrates the relation between some of the fields, using GPS TOW as exemplary reference.

```
-- ASN1START

GNSS-AcquisitionAssistance ::= SEQUENCE {
    gnss-SignalID          GNSS-SignalID,
    gnss-AcquisitionAssistList  GNSS-AcquisitionAssistList,

```
}
-- ASN1STOP
```

| <b>GNSS-AcquisitionAssistance field descriptions</b>  |
|---|
| <p><b>gnss-SignalID</b><br/>This field specifies the GNSS signal for which the acquisition assistance are provided.</p>   |
| <p><b>gnss-AcquisitionAssistList</b><br/>These fields provide a list of acquisition assistance data for each GNSS satellite.</p>  |
| <p><b>confidence</b><br/>This field specifies the confidence level of the reference location area or volume used to calculate the acquisition assistance parameters (search windows). A high percentage value (e.g., 98% or more) indicates to the target device that the provided search windows are reliable. The location server should include this field to indicate the confidence level of the provided information.</p>   |
| <p><b>svID</b><br/>This field specifies the GNSS SV-ID of the satellite for which the <i>GNSS-AcquisitionAssistance</i> is given.</p>   |
| <p><b>doppler0</b><br/>This field specifies the Doppler (0<sup>th</sup> order term) value. A positive value in Doppler defines the increase in satellite signal frequency due to velocity towards the target device. A negative value in Doppler defines the decrease in satellite signal frequency due to velocity away from the target device. Doppler is given in unit of m/s by multiplying the Doppler value in Hz by the nominal wavelength of the assisted signal.<br/>Scale factor 0.5 m/s in the range from -1024 m/s to +1023.5 m/s.</p>  |
| <p><b>doppler1</b><br/>This field specifies the Doppler (1<sup>st</sup> order term) value. A positive value defines the rate of increase in satellite signal frequency due to acceleration towards the target device. A negative value defines the rate of decrease in satellite signal frequency due to acceleration away from the target device.<br/>Scale factor 1/210 m/s<sup>2</sup> in the range from -0.2 m/s<sup>2</sup> to +0.1 m/s<sup>2</sup>.<br/>Actual value of Doppler (1<sup>st</sup> order term) is calculated as <math>(-42 + \text{doppler1}) * 1/210 \text{ m/s}^2</math>, with <i>doppler1</i> in the range of 0...63.</p>   |
| <p><b>dopplerUncertainty</b><br/>This field specifies the Doppler uncertainty value. It is defined such that the Doppler experienced by a stationary target device is in the range [Doppler–Doppler Uncertainty] to [Doppler+Doppler Uncertainty]. Doppler Uncertainty is given in unit of m/s by multiplying the Doppler Uncertainty value in Hz by the nominal wavelength of the assisted signal.<br/>Defined values: 2.5 m/s, 5 m/s, 10 m/s, 20 m/s, 40 m/s as encoded by an integer <i>n</i> in the range 0-4 according to:<br/><math>2^{-n}(40) \text{ m/s}; n = 0 - 4.</math><br/>If the <i>dopplerUncertaintyExt</i> field is present, the target device that supports the <i>dopplerUncertaintyExt</i> shall ignore this field.</p> |
| <p><b>codePhase</b><br/>This field together with the <i>codePhase1023</i> field specifies the code phase, in units of milli-seconds, in the range from 0 to 1 millisecond scaled by the nominal chipping rate of the GNSS signal, where increasing values of the field signify increasing predicted signal code phases, as seen by a receiver at the reference location at the reference time. The reference location would typically be an apriori estimate of the target device location.<br/>Scale factor <math>2^{-10}</math> ms in the range from 0 to <math>(1-2^{-10})</math> ms.<br/>Note: The value <math>(1-2^{-10})</math> ms is encoded using the <i>codePhase1023</i> IE.</p>  |
| <p><b>intCodePhase</b><br/>This field contains integer code phase (expressed modulo 128 ms). The satellite integer milli-seconds code phase currently being transmitted at the reference time, as seen by a receiver at the reference location is calculated as reference time (expressed in milli-seconds) minus (<i>intCodePhase</i> + (<i>n</i>×128 ms)), as shown in Figure 6.5.2.2-1, with <i>n</i> = ...-2,-1,0,1,2...<br/>Scale factor 1 ms in the range from 0 to 127 ms.</p>   |
| <p><b>codePhaseSearchWindow</b><br/>This field contains the code phase search window. The code phase search window accounts for the uncertainty in the estimated target device location but not any uncertainty in reference time. It is defined such that the expected code phase is in the range [Code Phase–Code Phase Search Window] to [Code Phase+Code Phase Search Window] given in units of milli-seconds.<br/>Range 0-31, mapping according to the table <i>codePhaseSearchWindow Value to Interpretation Code Phase Search Window [ms]</i> relation shown below.</p>  |
| <p><b>azimuth</b><br/>This field specifies the azimuth angle. An angle of <i>x</i> degrees means the satellite azimuth <i>a</i> is in the range <math>(x \leq a &lt; x+0.703125)</math> degrees.<br/>Scale factor 0.703125 degrees.</p>   |
| <p><b>elevation</b><br/>This field specifies the elevation angle. An angle of <i>y</i> degrees means the satellite elevation <i>e</i> is in the range <math>(y \leq e &lt; y+0.703125)</math> degrees.<br/>Scale factor 0.703125 degrees.</p>   |

**GNSS-AcquisitionAssistance field descriptions****codePhase1023**

This field if set to TRUE indicates that the code phase has the value  $1023 \times 2^{-10} = (1-2^{-10})$  ms. This field may only be set to TRUE if the value provided in the *codePhase* IE is 1022. If this field is set to FALSE, the code phase is the value provided in the *codePhase* IE in the range from 0 to  $(1 - 2 \times 2^{-10})$  ms. If this field is not present and the *codePhase* IE has the value 1022, the target device may assume that the code phase is between  $(1 - 2 \times 2^{-10})$  and  $(1 - 2^{-10})$  ms.

**dopplerUncertaintyExt**

If this field is present, the target device that supports this field shall ignore the *dopplerUncertainty* field. The location server should include this field only if supported by the target device.

This field specifies the Doppler uncertainty value. It is defined such that the Doppler experienced by a stationary target device is in the range [Doppler–Doppler Uncertainty] to [Doppler+Doppler Uncertainty]. Doppler Uncertainty is given in unit of m/s by multiplying the Doppler Uncertainty value in Hz by the nominal wavelength of the assisted signal.

Enumerated values define 60 m/s, 80 m/s, 100 m/s, 120 m/s, and "No Information".

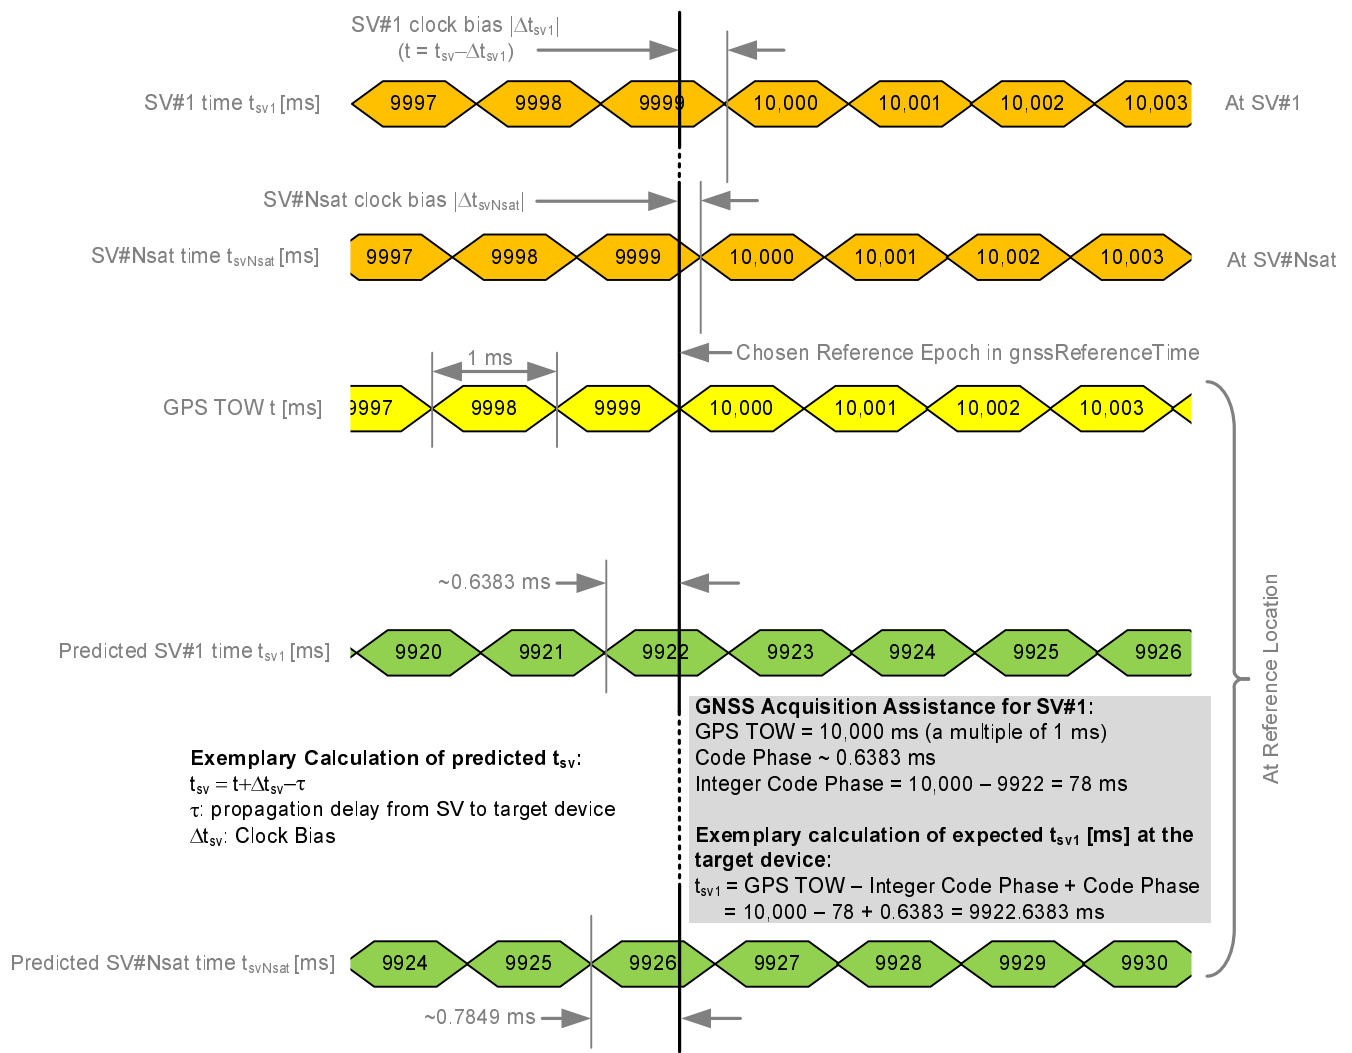

Figure 6.5.2.2-1: Exemplary calculation of some GNSS Acquisition Assistance fields.

## GNSS-Almanac

The IE *GNSS-Almanac* is used by the location server to provide the coarse, long-term model of the satellite positions and clocks. The meaning of these parameters is defined in relevant ICDs of the particular GNSS and GNSS specific interpretations apply. For example, GPS and QZSS use the same model parameters but some parameters have a different interpretation [7]. *GNSS-Almanac* is useful for receiver tasks that require coarse accuracy, such as determining satellite visibility. The model is valid for up to a few weeks, typically. Since it is a long-term model, the field should be provided for all satellites available in the GNSS constellation (i.e., not only for SVs visible at the reference location and including SVs flagged as unhealthy in almanac). The *completeAlmanacProvided* field indicates whether or not the location server provided almanacs for the complete GNSS constellation.

```

#### GNSS-Almanac field descriptions

##### **weekNumber**

This field specifies the almanac reference week number in GNSS specific system time to which the almanac reference time *toa* is referenced, modulo 256 weeks. This field is required for non-GLONASS GNSS.

Note, in case of Galileo, the almanac reference week number  $WN_a$  natively contains only the 2 LSB's [8, section 5.1.10].

##### **toa, toa-ext**

In case of *GNSS-ID* does not indicate Galileo, this field specifies the almanac reference time given in GNSS specific system time, in units of seconds with a scale factor of  $2^{12}$ . *toa* is required for non-GLONASS GNSS.

In case of *GNSS-ID* does indicate Galileo, this field specifies the almanac reference time given in GNSS specific system time, in units of seconds with a scale factor of 600 seconds. Either *toa* or *toa-ext* is required for Galileo GNSS.

##### **ioda, ioda-ext**

This field specifies the issue of data. Either *ioda* or *ioda-ext* is required for Galileo GNSS.

##### **completeAlmanacProvided**

If set to TRUE, the *gnss-AlmanacList* contains almanacs for the complete GNSS constellation indicated by *GNSS-ID*.

##### **gnss-AlmanacList**

This list contains the almanac model for each GNSS satellite in the GNSS constellation.

#### AlmanacKeplerianSet field descriptions

##### **svID**

This field identifies the satellite for which the GNSS Almanac Model is given.

##### **kepAlmanacE**

Parameter *e*, eccentricity, dimensionless [8].

Scale factor  $2^{-16}$ .

##### **kepAlmanacDeltaI**

Parameter  $\delta_i$ , inclination at reference time relative to  $i_0=56^\circ$ ; semi-circles [8].

Scale factor  $2^{-14}$  semi-circles.

##### **kepAlmanacOmegaDot**

Parameter  $\dot{\Omega}$ , rate of right ascension (semi-circles/sec) [8].

Scale factor  $2^{-33}$  semi-circles/seconds.

##### **kepSV-StatusINAV**

This field contains the I/NAV signal health status [8, section 5.1.10].

## – GNSS-UTC-Model

The IE *GNSS-UTC-Model* is used by the location server to provide several sets of parameters needed to relate GNSS system time to Universal Time Coordinate (UTC), as defined in [4], [5], [6], [7], [8], [9], [10], [23].

The UTC time standard, UTC(k), is GNSS specific. E.g., if *GNSS-ID* indicates GPS, *GNSS-UTC-Model* contains a set of parameters needed to relate GPS system time to UTC(USNO); if *GNSS-ID* indicates QZSS, *GNSS-UTC-Model* contains a set of parameters needed to relate QZST to UTC(NICT); if *GNSS-ID* indicates GLONASS, *GNSS-UTC-Model* contains a set of parameters needed to relate GLONASS system time to UTC(RU); if *GNSS-ID* indicates SBAS, *GNSS-UTC-Model* contains a set of parameters needed to relate SBAS network time for the SBAS indicated by *SBAS-ID* to the UTC standard defined by the UTC Standard ID; if *GNSS-ID* indicates BDS, *GNSS-UTC-Model* contains a set of parameters needed to relate BDS system time to UTC (NTSC).

```
-- ASN1START
GNSS-UTC-Model ::= CHOICE {
    utcModel1      UTC-ModelSet1,          -- Model-1
    utcModel2      UTC-ModelSet2,          -- Model-2
    utcModel3      UTC-ModelSet3,          -- Model-3
    utcModel4      UTC-ModelSet4,          -- Model-4
    ...,
    utcModel5-r12  UTC-ModelSet5-r12      -- Model-5
}
-- ASN1STOP
```

### – GNSS-AuxiliaryInformation

The IE *GNSS-AuxiliaryInformation* is used by the location server to provide additional information dependent on the *GNSS-ID*. If *GNSS-AuxiliaryInformation* is provided together with other satellite dependent GNSS assistance data (i.e., any of *GNSS-DifferentialCorrections*, *GNSS-NavigationModel*, *GNSS-DataBitAssistance*, or *GNSS-AcquisitionAssistance* IEs), the *GNSS-AuxiliaryInformation* should be provided for the same satellites and in the same LPP message as the other satellite dependent GNSS assistance data.

```

-- ASN1START
GNSS-AuxiliaryInformation ::= CHOICE {
    gnss-ID-GPS          GNSS-ID-GPS,
    gnss-ID-GLONASS     GNSS-ID-GLONASS,
    ...
}

GNSS-ID-GPS ::= SEQUENCE (SIZE(1..64)) OF GNSS-ID-GPS-SatElement

GNSS-ID-GPS-SatElement ::= SEQUENCE {
    svID                SV-ID,
    signalsAvailable    GNSS-SignalIDs,
    ...
}

GNSS-ID-GLONASS ::= SEQUENCE (SIZE(1..64)) OF GNSS-ID-GLONASS-SatElement

GNSS-ID-GLONASS-SatElement ::= SEQUENCE {
    svID                SV-ID,
    signalsAvailable    GNSS-SignalIDs,
    channelNumber       INTEGER (-7..13) OPTIONAL, -- Cond FDMA
    ...
}
-- ASN1STOP
    
```

| Conditional presence | Explanation   |
|----------------------|---|
| <i>FDMA</i>          | The field is mandatory present if the GLONASS SV indicated by <i>svID</i> broadcasts FDMA signals; otherwise it is not present. |

| <b>GNSS-AuxiliaryInformation field descriptions</b>  |
|--|
| <p><b>gnss-ID-GPS</b><br/>This choice may only be present if <i>GNSS-ID</i> indicates GPS.</p>   |
| <p><b>gnss-ID-GLONASS</b><br/>This choice may only be present if <i>GNSS-ID</i> indicates GLONASS.</p>   |
| <p><b>svID</b><br/>This field specifies the GNSS SV for which the <i>GNSS-AuxiliaryInformation</i> is given.</p>   |
| <p><b>signalsAvailable</b><br/>This field indicates the ranging signals supported by the satellite indicated by <i>svID</i>. This field is given as a bit string as defined in <i>GNSS-SignalIDs</i> for a particular GNSS. If a bit is set to "1" it indicates that the satellite identified by <i>svID</i> transmits ranging signals according to the signal correspondence in <i>GNSS-SignalIDs</i>. If a bit is set to "0" it indicates that the corresponding signal is not supported on the satellite identified by <i>svID</i>.</p> |
| <p><b>channelNumber</b><br/>This field indicates the GLONASS carrier frequency number of the satellite identified by <i>svID</i>, as defined in [9].</p>   |

## – BDS-DifferentialCorrections

The IE *BDS-DifferentialCorrections* is used by the location server to provide differential corrections to the target device.

```

-- ASN1START
BDS-DifferentialCorrections-r12 ::= SEQUENCE {
    dbds-RefTime-r12          INTEGER (0..3599),
    bds-SgnTypeList-r12      BDS-SgnTypeList-r12,
    ...
}
BDS-SgnTypeList-r12 ::= SEQUENCE (SIZE (1..3)) OF BDS-SgnTypeElement-r12
BDS-SgnTypeElement-r12 ::= SEQUENCE {
    gnss-SignalID            GNSS-SignalID          OPTIONAL, -- Need ON
    dbds-CorrectionList-r12 DBDS-CorrectionList-r12,
    ...
}
DBDS-CorrectionList-r12 ::= SEQUENCE (SIZE (1..64)) OF DBDS-CorrectionElement-r12
DBDS-CorrectionElement-r12 ::= SEQUENCE {
    svID                    SV-ID,
    bds-UDREI-r12           INTEGER (0..15),
    bds-RURAI-r12           INTEGER (0..15),
    bds-ECC-DeltaT-r12     INTEGER (-4096..4095),
    ...
}
-- ASN1STOP

```

| <b>BDS-DifferentialCorrections field descriptions</b>   |
|---|
| <p><b>dbds-RefTime</b><br/>This field <i>specifies</i> the time for which the differential corrections are valid, modulo 1 hour. <i>dbds-RefTime</i> is given in BDS system time.<br/>Scale factor 1-second.</p>  |
| <p><b>bds-UDREI</b><br/>This field indicates user differential range error information by user differential range error index (UDREI) as defined in [23], 5.3.3.7.2.</p>  |
| <p><b>bds-RURAI</b><br/>This field indicates Regional User Range Accuracy (RURA) information by Regional User Range Accuracy Index (UDREI) as defined in [23, 5.3.3.6].</p>   |
| <p><b>bds-ECC-DeltaT</b><br/>This field indicates the BDS differential correction information which is expressed in equivalent clock correction (<math>\Delta t</math>). Add the value of <math>\Delta t</math> to the observed pseudo-range to correct the effect caused by the satellite clock offset and ephemeris error. Value -4096 means the <math>\Delta t</math> is not available.<br/>The scale factor is 0.1 meter.</p> |

## BDS-GridModelParameter

```

-- ASN1START
BDS-GridModelParameter-r12 ::= SEQUENCE {
    bds-RefTime-r12          INTEGER (0..3599),
    gridIonList-r12         GridIonList-r12,
    ...
}

GridIonList-r12 ::= SEQUENCE (SIZE (1..320)) OF GridIonElement-r12

GridIonElement-r12 ::= SEQUENCE {
    igp-ID-r12              INTEGER (1..320),
    dt-r12                  INTEGER (0..511),
    givei-r12               INTEGER (0..15),
    ...
}
-- ASN1STOP

```

### BDS-GridModelParameter field descriptions

|                    |   |
|--------------------|---|
| <b>bds-RefTime</b> | This field specifies the time for which the grid model parameters are valid, modulo 1 hour. <i>bds-RefTime</i> is given in BDS system time.<br>Scale factor 1-second.   |
| <b>gridIonList</b> | This list provides ionospheric grid point information for each grid point. Up to 16 instances are used in this version of the specification. The values 17 to 320 are reserved for future use.  |
| <b>igp-ID</b>      | This field indicates the ionospheric grid point (IGP) number as defined in [23, 5.3.3.8].   |
| <b>dt</b>          | This field indicates $d_T$ as defined in [23, 5.3.3.8.1], i.e. the vertical delay at the corresponding IGP indicated by <i>igp-ID</i> . The scale factor is 0.125 meter.  |
| <b>givei</b>       | This field indicates the Grid Ionospheric Vertical Error Index (GIVEI) which is used to describe the delay correction accuracy at ionospheric grid point indicated by <i>igp-ID</i> , the mapping between GIVEI and GIVE is defined in [23, 5.3.3.8.2]. |

## 6.5.2.3 GNSS Assistance Data Request

### A-GNSS-RequestAssistanceData

The IE *A-GNSS-RequestAssistanceData* is used by the target device to request GNSS assistance data from a location server.

```

-- ASN1START
A-GNSS-RequestAssistanceData ::= SEQUENCE {
    gnss-CommonAssistDataReq  GNSS-CommonAssistDataReq      OPTIONAL, -- Cond CommonADReq
    gnss-GenericAssistDataReq  GNSS-GenericAssistDataReq      OPTIONAL, -- Cond GenADReq
    ...
}
-- ASN1STOP

```

| Conditional presence | Explanation   |
|----------------------|---|
| <i>CommonADReq</i>   | The field is mandatory present if the target device requests <i>GNSS-CommonAssistData</i> ; otherwise it is not present.                                |
| <i>GenADReq</i>      | This field is mandatory present if the target device requests <i>GNSS-GenericAssistData</i> for one or more specific GNSS; otherwise it is not present. |

## – GNSS-CommonAssistDataReq

The IE *GNSS-CommonAssistDataReq* is used by the target device to request assistance data that are applicable to any GNSS from a location server.

```
-- ASN1START
GNSS-CommonAssistDataReq ::= SEQUENCE {
  gnss-ReferenceTimeReq          GNSS-ReferenceTimeReq          OPTIONAL, -- Cond RefTimeReq
  gnss-ReferenceLocationReq      GNSS-ReferenceLocationReq      OPTIONAL, -- Cond RefLocReq
  gnss-IonosphericModelReq       GNSS-IonosphericModelReq       OPTIONAL, -- Cond IonoModReq
  gnss-EarthOrientationParametersReq GNSS-EarthOrientationParametersReq OPTIONAL, -- Cond EOPReq
  ...
}
-- ASN1STOP
```

| Conditional presence | Explanation   |
|----------------------|---|
| <i>RefTimeReq</i>    | The field is mandatory present if the target device requests <i>GNSS-ReferenceTime</i> ; otherwise it is not present.               |
| <i>RefLocReq</i>     | This field is mandatory present if the target device requests <i>GNSS-ReferenceLocation</i> ; otherwise it is not present.          |
| <i>IonoModReq</i>    | This field is mandatory present if the target device requests <i>GNSS-IonosphericModel</i> ; otherwise it is not present.           |
| <i>EOPReq</i>        | This field is mandatory present if the target device requests <i>GNSS-EarthOrientationParameters</i> ; otherwise it is not present. |

## – GNSS-GenericAssistDataReq

The IE *GNSS-GenericAssistDataReq* is used by the target device to request assistance data from a location server for one or more specific GNSS (e.g., GPS, Galileo, GLONASS, BDS, etc.). The specific GNSS for which the assistance data are requested is indicated by the IE *GNSS-ID* and (if applicable) by the IE *SBAS-ID*. Assistance for up to 16 GNSSs can be requested.

```
-- ASN1START
GNSS-GenericAssistDataReq ::= SEQUENCE (SIZE (1..16)) OF GNSS-GenericAssistDataReqElement
GNSS-GenericAssistDataReqElement ::= SEQUENCE {
  gnss-ID          GNSS-ID,
  sbas-ID          SBAS-ID          OPTIONAL, -- Cond GNSS-ID-SBAS

#### 6.5.2.4 GNSS Assistance Data Request Elements

##### – GNSS-ReferenceTimeReq

The IE *GNSS-ReferenceTimeReq* is used by the target device to request the *GNSS-ReferenceTime* assistance from the location server.

```
-- ASN1START
GNSS-ReferenceTimeReq ::= SEQUENCE {
    gnss-TimeReqPrefList SEQUENCE (SIZE (1..8)) OF GNSS-ID,
    gps-TOW-assistReq    BOOLEAN                OPTIONAL, -- Cond gps
    notOfLeapSecReq     BOOLEAN                OPTIONAL, -- Cond glonass
    ...
}
-- ASN1STOP
```

| Conditional presence | Explanation   |
|----------------------|---|
| <i>gps</i>           | The field is mandatory present if <i>gnss-TimeReqPrefList</i> includes a <i>GNSS-ID</i> = "gps"; otherwise it is not present.     |
| <i>glonass</i>       | The field is mandatory present if <i>gnss-TimeReqPrefList</i> includes a <i>GNSS-ID</i> = "glonass"; otherwise it is not present. |

#### **GNSS-ReferenceTimeReq field descriptions**

|                                    |  |
|------------------------------------|--|
| <b><i>gnss-TimeReqPrefList</i></b> | This field is used by the target device to request the system time for a specific GNSS, specified by <i>GNSS-ID</i> in the order of preference. The first <i>GNSS-ID</i> in the list is the most preferred GNSS for reference time, the second <i>GNSS-ID</i> is the second most preferred, etc. |
| <b><i>gps-TOW-assistReq</i></b>    | This field is used by the target device to request the <i>gps-TOW-Assist</i> field in <i>GNSS-SystemTime</i> . TRUE means requested.   |
| <b><i>notOfLeapSecReq</i></b>      | This field is used by the target device to request the <i>notificationOfLeapSecond</i> field in <i>GNSS-SystemTime</i> . TRUE means requested.   |

##### – GNSS-ReferenceLocationReq

The IE *GNSS-ReferenceLocationReq* is used by the target device to request the *GNSS-ReferenceLocation* assistance from the location server.

```
-- ASN1START
GNSS-ReferenceLocationReq ::= SEQUENCE {
    ...
}
-- ASN1STOP
```

## – GNSS-IonosphericModelReq

The IE *GNSS-IonosphericModelReq* is used by the target device to request the *GNSS-IonosphericModel* assistance from the location server.

```
-- ASN1START
GNSS-IonosphericModelReq ::= SEQUENCE {
    klobucharModelReq BIT STRING (SIZE(2)) OPTIONAL, -- Cond klobuchar
    neQuickModelReq  NULL          OPTIONAL, -- Cond nequick
    ...
}
-- ASN1STOP
```

| Conditional presence | Explanation   |
|----------------------|---|
| <i>klobuchar</i>     | The field is mandatory present if the target device requests <i>klobucharModel</i> ; otherwise it is not present. The BIT STRING defines the dataID requested, defined in IE <i>KlobucharModelParameter</i> . |
| <i>nequick</i>       | The field is mandatory present if the target device requests <i>neQuickModel</i> ; otherwise it is not present.   |

## – GNSS-EarthOrientationParametersReq

The IE *GNSS-EarthOrientationParametersReq* is used by the target device to request the *GNSS-EarthOrientationParameters* assistance from the location server.

```
-- ASN1START
GNSS-EarthOrientationParametersReq ::= SEQUENCE {
    ...
}
-- ASN1STOP
```

## – GNSS-TimeModelListReq

The IE *GNSS-TimeModelListReq* is used by the target device to request the *GNSS-TimeModelElement* assistance from the location server.

```
-- ASN1START
GNSS-TimeModelListReq ::= SEQUENCE (SIZE(1..15)) OF GNSS-TimeModelElementReq
GNSS-TimeModelElementReq ::= SEQUENCE {
    gnss-TO-IDsReq INTEGER (1..15),
    deltaTreq      BOOLEAN,
    ...
}
-- ASN1STOP
```

### GNSS-TimeModelElementReq field descriptions

#### **gnss-TO-IDsReq**

This field specifies the requested *gnss-TO-ID*. The meaning and encoding is the same as the *gnss-TO-ID* field in the *GNSS-TimeModelElement* IE.

**GNSS-TimeModelElementReq field descriptions****deltaTreq**

This field specifies whether or not the location server is requested to include the *deltaT* field in the *GNSS-TimeModelElement* IE. TRUE means requested.

**GNSS-DifferentialCorrectionsReq**

The IE *GNSS-DifferentialCorrectionsReq* is used by the target device to request the *GNSS-DifferentialCorrections* assistance from the location server.

```
-- ASN1START
GNSS-DifferentialCorrectionsReq ::= SEQUENCE {
    dgnss-SignalsReq      GNSS-SignalIDs,
    dgnss-ValidityTimeReq  BOOLEAN,
    ...
}
-- ASN1STOP
```

**GNSS-DifferentialCorrectionsReq field descriptions****dgnss-SignalsReq**

This field specifies the GNSS Signal(s) for which the *GNSS-DifferentialCorrections* are requested. A one-value at a bit position means DGNSS corrections for the specific signal are requested; a zero-value means not requested. The target device shall set a maximum of three bits to value "one".

**dgnss-ValidityTimeReq**

This field specifies whether the *udreGrowthRate* and *udreValidityTime* in *GNSS-DifferentialCorrections* are requested or not. TRUE means requested.

**GNSS-NavigationModelReq**

The IE *GNSS-NavigationModelReq* is used by the target device to request the *GNSS-NavigationModel* assistance from the location server.

```
-- ASN1START
GNSS-NavigationModelReq ::= CHOICE {
    storedNavList      StoredNavListInfo,
    reqNavList         ReqNavListInfo,
    ...
}

StoredNavListInfo ::= SEQUENCE {
    gnss-WeekOrDay      INTEGER (0..4095),
    gnss-Toe             INTEGER (0..255),
    t-toeLimit          INTEGER (0..15),
    satListRelatedDataList  SatListRelatedDataList OPTIONAL,
    ...
}

SatListRelatedDataList ::= SEQUENCE (SIZE (1..64)) OF SatListRelatedDataElement

SatListRelatedDataElement ::= SEQUENCE {
    svID                SV-ID,
    iod                 BIT STRING (SIZE(11)),
    clockModelID        INTEGER (1..8) OPTIONAL,
    orbitModelID        INTEGER (1..8) OPTIONAL,
    ...
}

ReqNavListInfo ::= SEQUENCE {
    svReqList           BIT STRING (SIZE (64)),
    clockModelID-PrefList  SEQUENCE (SIZE (1..8)) OF INTEGER (1..8) OPTIONAL,
    orbitModelID-PrefList  SEQUENCE (SIZE (1..8)) OF INTEGER (1..8) OPTIONAL,
    addNavparamReq      BOOLEAN OPTIONAL, -- Cond orbitModelID-2
    ...
}
```

-- ASN1STOP

| Conditional presence  | Explanation   |
|-----------------------|---|
| <i>orbitModelID-2</i> | The field is mandatory present if <i>orbitModelID-PrefList</i> is absent or includes a Model-ID = "2"; otherwise it is not present. |

| <b>GNSS-<i>NavigationModelReq</i> field descriptions</b>  |   |
|---|---|
| <b><i>storedNavList</i></b>                               | This list provides information to the location server about which <i>GNSS-NavigationModel</i> data the target device has currently stored for the particular GNSS indicated by <i>GNSS-ID</i> .   |
| <b><i>reqNavList</i></b>                                  | This list provides information to the location server which <i>GNSS-NavigationModel</i> data are requested by the target device.  |
| <b><i>gnss-WeekOrDay</i></b>                              | If <i>GNSS-ID</i> does not indicate "glonass", this field defines the GNSS Week number of the assistance currently held by the target device.<br>If <i>GNSS-ID</i> is set to "glonass", this field defines the calendar number of day within the four-year interval starting from 1 <sup>st</sup> of January in a leap year, as defined by the parameter $N_T$ in [9] of the assistance currently held by the target device.  |
| <b><i>gnss-Toe</i></b>                                    | If <i>GNSS-ID</i> does not indicate "glonass", this field defines the GNSS time of ephemeris in hours of the latest ephemeris set contained by the target device.<br>If <i>GNSS-ID</i> is set to "glonass", this field defines the time of ephemeris in units of 15 minutes of the latest ephemeris set contained by the target device (range 0 to 95 representing time values between 0 and 1425 minutes). In this case, values 96 to 255 shall not be used by the sender. |
| <b><i>t-toeLimit</i></b>                                  | If <i>GNSS-ID</i> does not indicate "glonass", this IE defines the ephemeris age tolerance of the target device in units of hours.<br>If <i>GNSS-ID</i> is set to "glonass", this IE defines the ephemeris age tolerance of the target device in units of 30 minutes.   |
| <b><i>satListRelatedDataList</i></b>                      | This list defines the clock and orbit models currently held by the target device for each SV. This field is not included if the target device does not have any stored clock and orbit models for any SV.   |
| <b><i>svID</i></b>  | This field identifies the particular GNSS satellite.  |
| <b><i>iod</i></b>   | This field identifies the issue of data currently held by the target device.  |
| <b><i>clockModelID, orbitModelID</i></b>                  | These fields define the clock and orbit model number currently held by the target device. If these fields are absent, the default interpretation of the table GNSS-ID to clockModelID & orbitModelID relation below applies.  |
| <b><i>svReqList</i></b>                                   | This field defines the SV for which the navigation model assistance is requested. Each bit position in this BIT STRING represents a <i>SV-ID</i> . Bit 0 represents <i>SV-ID</i> =0 and bit 63 represents <i>SV-ID</i> =63. A one-value at a bit position means the navigation model data for the corresponding <i>SV-ID</i> is requested, a zero-value means not requested.  |
| <b><i>clockModelIDPrefList, orbitModelID-PrefList</i></b> | These fields define the Model-IDs of the clock and orbit models that the target device wishes to obtain in the order of preference. The first Model-ID in the list is the most preferred model, the second Model-ID the second most preferred, etc. If these fields are absent, the default interpretation of the table GNSS-ID to clockModelID-PrefList & orbitModelIDPrefList relation below applies.   |
| <b><i>addNavparamReq</i></b>                              | This field specifies whether the location server is requested to include the <i>addNAVparam</i> fields in <i>GNSS-NavigationModel</i> IE ( <i>NavModel-NAVKeplerianSet</i> field) or not. TRUE means requested.   |

#### GNSS-ID to clockModelID & orbitModelID relation

| <b><i>GNSS-ID</i></b> | <b><i>clockModelID</i></b> | <b><i>orbitModelID</i></b> |
|-----------------------|----------------------------|----------------------------|
| gps                   | 2                          | 2                          |
| sbas                  | 5                          | 5                          |
| qzss                  | 2                          | 2                          |
| galileo               | 1                          | 1                          |
| glonass               | 4                          | 4                          |
| bds                   | 6                          | 6                          |

### GNSS-ID to clockModelID-PrefList & orbitModelID-PrefList relation

| <b>GNSS-ID</b> | <b>clockModelID-PrefList</b> | <b>orbitModelID-PrefList</b> |
|----------------|------------------------------|------------------------------|
| gps            | Model-2                      | Model-2                      |
| sbas           | Model-5                      | Model-5                      |
| qzss           | Model-2                      | Model-2                      |
| galileo        | Model-1                      | Model-1                      |
| glonass        | Model-4                      | Model-4                      |
| bds            | Model-6                      | Model-6                      |

### – GNSS-RealTimeIntegrityReq

The IE *GNSS-RealTimeIntegrityReq* is used by the target device to request the *GNSS-RealTimeIntegrity* assistance from the location server.

```
-- ASN1START
GNSS-RealTimeIntegrityReq ::= SEQUENCE {
    ...
}
-- ASN1STOP
```

### – GNSS-DataBitAssistanceReq

The IE *GNSS-DataBitAssistanceReq* is used by the target device to request the *GNSS-DataBitAssistance* assistance from the location server.

```
-- ASN1START
GNSS-DataBitAssistanceReq ::= SEQUENCE {
    gnss-TOD-Req          INTEGER (0..3599),
    gnss-TOD-FracReq     INTEGER (0..999)          OPTIONAL,
    dataBitInterval      INTEGER (0..15),
    gnss-SignalType      GNSS-SignalIDs,
    gnss-DataBitsReq     GNSS-DataBitsReqSatList OPTIONAL,
    ...
}
GNSS-DataBitsReqSatList ::= SEQUENCE (SIZE(1..64)) OF GNSS-DataBitsReqSatElement
GNSS-DataBitsReqSatElement ::= SEQUENCE {
    svID                 SV-ID,
    ...
}
-- ASN1STOP
```

#### GNSS-DataBitAssistanceReq field descriptions

##### **gnss-TOD-Req**

This field specifies the reference time for the first data bit requested in GNSS specific system time, modulo 1 hour. Scale factor 1 second.

##### **gnss-TOD-FracReq**

This field specifies the fractional part of *gnss-TOD-Req* in 1-milli-second resolution. Scale factor 1 millisecond.

##### **dataBitInterval**

This field specifies the time length for which the Data Bit Assistance is requested. The *GNSS-DataBitAssistance* shall be relative to the time interval (*gnss-TOD-Req*, *gnss-TOD-Req* + *dataBitInterval*).

The *dataBitInterval* *r*, expressed in seconds, is mapped to a binary number K with the following formula:

$$r = 0.1 \times 2^K$$

Value K=15 means that the time interval is not specified.

##### **gnss-SignalType**

This field specifies the GNSS Signal(s) for which the *GNSS-DataBitAssistance* are requested. A one-value at a bit position means *GNSS-DataBitAssistance* for the specific signal is requested; a zero-value means not requested.

##### **gnss-DataBitsReq**

This list contains the SV-IDs for which the *GNSS-DataBitAssistance* is requested.

## – GNSS-AcquisitionAssistanceReq

The IE *GNSS-AcquisitionAssistanceReq* is used by the target device to request the *GNSS-AcquisitionAssistance* assistance from the location server.

```
-- ASN1START
GNSS-AcquisitionAssistanceReq ::= SEQUENCE {
    gnss-SignalID-Req      GNSS-SignalID,
    ...
}
-- ASN1STOP
```

### **GNSS-AcquisitionAssistanceReq field descriptions**

#### ***gnss-SignalID-Req***

This field specifies the GNSS signal type for which *GNSSAcquisitionAssistance* is requested.

## – GNSS-AlmanacReq

The IE *GNSS-AlmanacReq* is used by the target device to request the *GNSS-Almanac* assistance from the location server.

```
-- ASN1START
GNSS-AlmanacReq ::= SEQUENCE {
    modelID                INTEGER (1..8)    OPTIONAL,
    ...
}
-- ASN1STOP
```

### **GNSS-AlmanacReq field descriptions**

#### ***modelID***

This field specifies the Almanac Model ID requested. If this field is absent, the default interpretation as in the table GNSS-ID to modelID relation below applies.

#### **GNSS-ID to modelID relation**

| <b><i>GNSS-ID</i></b> | <b><i>modelID</i></b> |
|-----------------------|-----------------------|
| gps                   | 2                     |
| sbas                  | 6                     |
| qzss                  | 2                     |
| galileo               | 1                     |
| glonass               | 5                     |
| bds                   | 7                     |

## – GNSS-UTC-ModelReq

The IE *GNSS-UTC-ModelReq* is used by the target device to request the *GNSS-UTC-Model* assistance from the location server.

```
-- ASN1START
GNSS-UTC-ModelReq ::= SEQUENCE {
    modelID                INTEGER (1..8)    OPTIONAL,
    ...
}
-- ASN1STOP
```

**GNSS-UTC-ModelReq field descriptions****modelID**

This field specifies the *GNSS-UTCModel* set requested. If this field is absent, the default interpretation as in the table GNSS-ID to modelID relation below applies.

**GNSS-ID to modelID relation**

| <b>GNSS-ID</b> | <b>modelID</b> |
|----------------|----------------|
| gps            | 1              |
| sbas           | 4              |
| qzss           | 1              |
| galileo        | 1              |
| glonass        | 3              |
| bds            | 5              |

### – GNSS-AuxiliaryInformationReq

The IE *GNSS-AuxiliaryInformationReq* is used by the target device to request the *GNSS-AuxiliaryInformation* assistance from the location server.

```
-- ASN1START
GNSS-AuxiliaryInformationReq ::= SEQUENCE {
    ...
}
-- ASN1STOP
```

### – BDS-DifferentialCorrectionsReq

The IE *BDS-DifferentialCorrectionsReq* is used by the target device to request the *BDS-DifferentialCorrections* assistance from the location server.

```
-- ASN1START
BDS-DifferentialCorrectionsReq-r12 ::= SEQUENCE {
    dgnss-SignalsReq          GNSS-SignalIDs,
    ...
}
-- ASN1STOP
```

**BDS-DifferentialCorrectionsReq field descriptions****dgnss-SignalsReq**

This field specifies the BDS Signal(s) for which the *BDS-DifferentialCorrections* are requested. A one-value at a bit position means BDS differential corrections for the specific signal are requested; a zero-value means not requested. The target device shall set a maximum of three bits to value "one".

### – BDS-GridModelReq

The IE *BDS-GridModelReq* is used by the target device to request the *BDS-GridModel* assistance from the location server.

```
-- ASN1START
BDS-GridModelReq-r12 ::= SEQUENCE {
    ...
}
-- ASN1STOP
```

### 6.5.2.5 GNSS Location Information

#### – A-GNSS-ProvideLocationInformation

The IE *A-GNSS-ProvideLocationInformation* is used by the target device to provide location measurements (e.g., pseudo-ranges, location estimate, velocity) to the location server, together with time information. It may also be used to provide GNSS positioning specific error reason.

```
-- ASN1START
A-GNSS-ProvideLocationInformation ::= SEQUENCE {
    gnss-SignalMeasurementInformation    GNSS-SignalMeasurementInformation    OPTIONAL,
    gnss-LocationInformation             GNSS-LocationInformation           OPTIONAL,
    gnss-Error                           A-GNSS-Error                       OPTIONAL,
    ...
}
-- ASN1STOP
```

### 6.5.2.6 GNSS Location Information Elements

#### – GNSS-SignalMeasurementInformation

The IE *GNSS-SignalMeasurementInformation* is used by the target device to provide GNSS signal measurement information to the location server and GNSS-network time association if requested by the location server. This information includes the measurements of code phase, Doppler,  $C/N_0$  and optionally accumulated carrier phase, also called accumulated deltarange (ADR), which enable the UE-assisted GNSS method where position is computed in the location server. Figure 6.5.2.6-1 illustrates the relation between some of the fields.

```
-- ASN1START
GNSS-SignalMeasurementInformation ::= SEQUENCE {
    measurementReferenceTime             MeasurementReferenceTime,
    gnss-MeasurementList                 GNSS-MeasurementList,
    ...
}
-- ASN1STOP
```

#### **GNSS-SignalMeasurementInformation field descriptions**

##### **measurementReferenceTime**

This field specifies the GNSS system time for which the information provided in *gnss-MeasurementList* is valid. It may also include network time, if requested by the location server and supported by the target device.

##### **gnss-MeasurementList**

This field provides GNSS signal measurement information for up to 16 GNSSs.

#### – MeasurementReferenceTime

The IE *MeasurementReferenceTime* is used to specify the time when the measurements provided in *A-GNSS-ProvideLocationInformation* are valid. It may also include GNSS-network time association, in which case reported measurements shall be valid for the cellular frame boundary defined in the network time association.

```

```

### MeasurementReferenceTime field descriptions

#### **gnss-TOD-msec**

This field specifies the GNSS TOD for which the measurements and/or location estimate are valid. The 22 bits of GNSS TOD are the least significant bits. The most significant bits shall be derived by the location server to unambiguously derive the GNSS TOD.

The value for GNSS TOD is derived from the GNSS specific system time indicated in *gnss-TimeID* rounded down to the nearest millisecond unit.

Scale factor 1 millisecond.

#### **gnss-TOD-frac**

This field specifies the fractional part of the GNSS TOD in 250 ns resolution. The total GNSS TOD is given by *gnss-TOD-msec* + *gnss-TOD-frac*.

Scale factor 250 nanoseconds.

#### **gnss-TOD-unc**

This field provides the accuracy of the relation GNSS-network time when GNSS-network time association is provided. When GNSS-network time association is not provided, this element can be included to provide the accuracy of the reported *gnss-TOD-msec*.

If GNSS TOD is the given GNSS time, then the true GNSS time, corresponding to the provided network time if applicable, as observed at the target device location, lies in the interval [GNSS TOD – *gnss-TOD-unc*, GNSS TOD + *gnss-TOD-unc*].

The uncertainty *r*, expressed in microseconds, is mapped to a number *K*, with the following formula:

$$r = C * (((1+x)^K) - 1)$$

with *C* = 0.5 and *x* = 0.14. To encode any higher value of uncertainty than that corresponding in the above formula to *K*=127, the same value, *K*=127, shall also be used. The uncertainty is then coded on 7 bits, as the binary encoding of *K*. Examples of *gnss-TOD-unc* value are as in the table Value of *K* to Value of uncertainty relation below.

This field shall be included if the target device provides GNSS-network time relationship.

#### **gnss-TimeID**

This field specifies the GNSS system time for which the *gnss-TOD-msec* (and *gnss-TOD-frac* if applicable) is provided.

#### **networkTime**

These fields specify the network time event which the GNSS TOD time stamps.

This field shall be included if the target device provides GNSS-network time relationship.

#### **physCellId**

This field identifies the reference cell, as defined in [12], that is used for the GNSS-network time relation.

| <b>MeasurementReferenceTime field descriptions</b>   |
|--|
| <p><b>cellGlobalId</b><br/>This field specifies the globally unique cell identifier (Evolved Cell Global Identifier (ECGI) in E-UTRA, global UTRAN Cell Identifier in UTRA, or Cell Global Identification (CGI) in GERAN) of the reference cell, as defined in [12] for E-UTRA and [13] for UTRA, for which the GNSS network time relation is provided.</p>  |
| <p><b>systemFrameNumber</b><br/>This field specifies the system frame number in E-UTRA which the GNSS time time stamps, as defined in [12].</p>  |
| <p><b>mode</b><br/>This field identifies the reference cell for the GNSS-network time relation, as defined in [13].</p>  |
| <p><b>referenceSystemFrameNumber</b><br/>This field specifies the system frame number in UTRA, as defined in [13], which is used for time stamping.</p>  |
| <p><b>bcchCarrier, bsic</b><br/>This field identifies the reference cell for the GNSS-network time relation in GERAN, as defined in [14].</p>  |
| <p><b>referenceFN, referenceFNMSB</b><br/>These fields specify the frame number in GERAN which the GNSS time time stamps, as defined in [14]. The time of the reference frame boundary is as observed by the target device, i.e. without Timing Advance compensation. The <i>referenceFNMSB</i> field indicates the most significant bits of the frame number of the reference BTS corresponding to the <i>GNSS-MeasurementList</i>. Starting from the complete GSM frame number denoted FN, the target device calculates Reference FN MSB as</p> $\text{Reference FN MSB} = \text{floor}(\text{FN}/42432)$ <p>The complete GSM frame number FN can then be reconstructed in the location server by combining the fields <i>referenceFN</i> with <i>referenceFNMSB</i> in the following way</p> $\text{FN} = \text{referenceFNMSB} * 42432 + \text{referenceFN}$ |
| <p><b>deltaGNSS-TOD</b><br/>This field specifies the difference in milliseconds between <i>gnss-TOD-msec</i> reported and the milli-second part of the SV time <i>tsv_1</i> of the first SV in the list reported from the target device, as defined in [14]. The <i>deltaGNSS-TOD</i> is defined as</p> $\text{deltaGNSS-TOD} = \text{gnss-TOD-msec} - \text{fix}(\text{tsv}_1)$ <p>where <i>fix()</i> denotes rounding to the nearest integer towards zero.</p>   |

#### Value of K to Value of uncertainty relation

| Value of K | Value of uncertainty   |
|------------|------------------------|
| 0          | 0 microseconds         |
| 1          | 0.07 microseconds      |
| 2          | 0.1498 microseconds    |
| -          | -                      |
| 50         | 349.62 microseconds    |
| -          | -                      |
| 127        | ≥ 8430000 microseconds |

## – GNSS-MeasurementList

The IE *GNSS-MeasurementList* is used by the target device to provide measurements of code phase, Doppler,  $C/N_0$  and optionally accumulated carrier phase, also called accumulated deltarange (ADR).

```
-- ASN1START
GNSS-MeasurementList ::= SEQUENCE (SIZE(1..16)) OF GNSS-MeasurementForOneGNSS
GNSS-MeasurementForOneGNSS ::= SEQUENCE {

```

### **GNSS-MeasurementList field descriptions**

|  |
|--|
| <p><b>gnss-ID</b><br/>This field identifies the GNSS constellation on which the GNSS signal measurements were measured. Measurement information for up to 16 GNSSs can be included.</p>  |
| <p><b>gnss-SgnMeasList</b><br/>This list provides GNSS signal measurement information for up to 8 GNSS signal types per GNSS.</p>  |
| <p><b>gnss-SignalID</b><br/>This field identifies the signal on which GNSS signal measurement parameters were measured.</p>  |
| <p><b>gnss-CodePhaseAmbiguity</b><br/>This field provides the ambiguity of the code phase measurement. It is given in units of milli-seconds in the range between between 0 and 127 milli-seconds.<br/>The total code phase for a satellite k (Satk) is given modulo this <i>gnss-CodePhaseAmbiguity</i> and is reconstructed with:<br/><math>Code\_Phase\_Tot(Satk) = codePhase(Satk) + integerCodePhase(Satk) + n * gnss-CodePhaseAmbiguity</math>, <math>n = 0,1,2,\dots</math><br/>If there is no code phase ambiguity, the <i>gnss-CodePhaseAmbiguity</i> shall be set to 0.<br/>The field is optional. If <i>gnss-CodePhaseAmbiguity</i> is absent, the default value is 1 milli-second.</p>   |
| <p><b>gnss-SatMeasList</b><br/>This list provides GNSS signal measurement information for up to 64 GNSS satellites.</p>  |
| <p><b>svID</b><br/>This field identifies the satellite on which the GNSS signal measurements were measured.</p>  |
| <p><b>cNo</b><br/>This field provides an estimate of the carrier-to-noise ratio of the received signal from the particular satellite. The target device shall set this field to the value of the satellite C/N<sub>0</sub>, as referenced to the antenna connector, in units of 1 dB-Hz, in the range from 0 to 63 dB-Hz.<br/>Scale factor 1 dB-Hz.</p>  |
| <p><b>mpathDet</b><br/>This field contains the multipath indicator value, defined in the table Value of mpathDet to Multipath Indication relation below.</p>   |
| <p><b>carrierQualityInd</b><br/>This field indicates the quality of a carrier phase measurement. The LSB indicates the data polarity, that is, if the data from a specific satellite is received inverted, this is indicated by setting the LSB value to "1". In the case the data is not inverted, the LSB is set to "0". The MSB indicates if accumulation of the carrier phase has been continuous, that is, without cycle slips since the previous measurement report. If the carrier phase accumulation has been continuous, the MSB value is set to "1X". Otherwise, the MSB is set to "0X".<br/>This field is optional but shall be included if the <i>adr</i> field is included. See table Bit toPolarity Indication relation below.</p> |
| <p><b>codePhase</b><br/>This field contains the whole and fractional value of the code-phase measurement made by the target device for the particular satellite signal at the time of measurement in the units of ms. GNSS specific code phase measurements (e.g. chips) are converted into unit of ms by dividing the measurements by the nominal values of the measured signal chipping rate.<br/>Scale factor <math>2^{-21}</math> milli-seconds, in the range from 0 to <math>(1-2^{-21})</math> milli-seconds.</p>  |
| <p><b>integerCodePhase</b><br/>This field indicates the integer milli-second part of the code phase that is expressed modulo the <i>gnss-CodePhaseAmbiguity</i>. The value of the ambiguity is given in the <i>gnss-CodePhaseAmbiguity</i> field.<br/>The <i>integerCodePhase</i> is optional. If <i>integerCodePhase</i> is absent, the default value is 0 milli-second.<br/>Scale factor 1 milli-second, in the range from 0 to 127 milli-seconds.</p>   |
| <p><b>codePhaseRMSError</b><br/>This field contains the pseudorange RMS error value. This parameter is specified according to a floating-point representation shown in the table below.</p>  |
| <p><b>doppler</b><br/>This field contains the Doppler measured by the target device for the particular satellite signal. This information can be used to compute the 3-D velocity of the target device. Doppler measurements are converted into unit of m/s by multiplying the Doppler measurement in Hz by the nominal wavelength of the measured signal.<br/>Scale factor 0.04 meter/seconds. This field is optional, but shall be included, if the <i>velocityRequest</i> in <i>CommonIESRequestLocationInformation</i> is set to TRUE.</p>   |

**GNSS-MeasurementList field descriptions****adr**

This field contains the ADR measurement measured by the target device for the particular satellite signal. This information can be used to compute the 3-D velocity or high-accuracy position of the target device. ADR measurements are converted into units of meter by multiplying the ADR measurement by the nominal wavelength of the measured signal.

Scale factor  $2^{-10}$  meters, in the range from 0 to 32767.5 meters. This field is optional, but shall be included, if the *adrMeasReq* in *GNSS-PositioningInstructions* is set to TRUE and if ADR measurements are supported by the target device (i.e., *adr-Support* is set to TRUE in *A-GNSS-ProvideCapabilities*).

**Value of mpathDet to Multipath Indication relation**

| Value of <i>mpathDet</i> | Multipath Indication        |
|--------------------------|-----------------------------|
| 00                       | Not measured                |
| 01                       | Low, MP error < 5m          |
| 10                       | Medium, 5m < MP error < 43m |
| 11                       | High, MP error > 43m        |

**Bit toPolarity Indication relation**

| Value | Polarity Indication                         |
|-------|---|
| 0     | Data Direct, carrier phase not continuous   |
| 1     | Data Inverted, carrier phase not continuous |
| 2     | Data Direct, carrier phase continuous       |
| 3     | Data Inverted, carrier phase continuous     |

**floating-point representation**

| Index | Mantissa | Exponent | Floating-Point value, $x_i$ | Pseudorange value, P   |
|-------|----------|----------|-----------------------------|------------------------|
| 0     | 000      | 000      | 0.5                         | $P < 0.5$              |
| 1     | 001      | 000      | 0.5625                      | $0.5 \leq P < 0.5625$  |
| l     | x        | y        | $0.5 * (1 + x/8) * 2^y$     | $x_{i-1} \leq P < x_i$ |
| 62    | 110      | 111      | 112                         | $104 \leq P < 112$     |
| 63    | 111      | 111      | --                          | $112 \leq P$           |

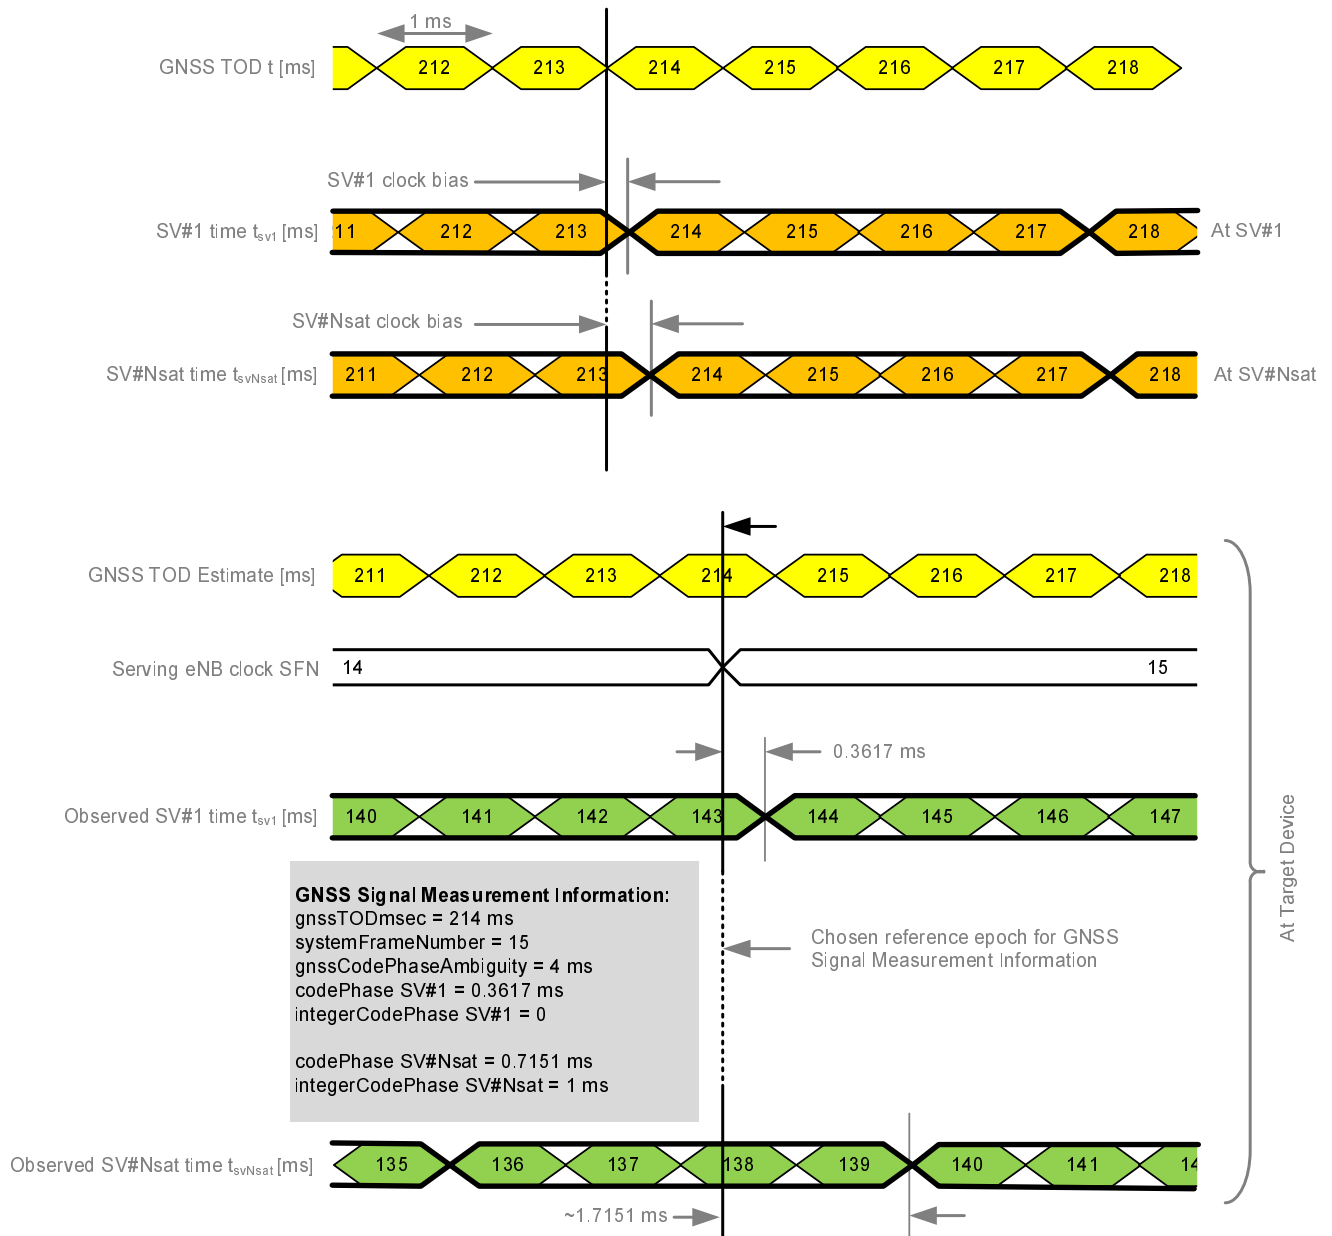

Figure 6.5.2.6-1: Exemplary calculation of some GNSS Signal Measurement Information fields.

GNSS-LocationInformation

The IE *GNSS-LocationInformation* is included by the target device when location and optionally velocity information derived using GNSS or hybrid GNSS and other measurements is provided to the location server.

```
-- ASN1START
GNSS-LocationInformation ::= SEQUENCE {
    measurementReferenceTime      MeasurementReferenceTime,
    agnss-List                    GNSS-ID-Bitmap,
    ...
}
-- ASN1STOP
```

GNSS-LocationInformation field descriptions

| <b>GNSS-LocationInformation field descriptions</b>   |
|--|
| <p><b>measurementReferenceTime</b><br/>This field specifies the GNSS system time for which the location estimate and optionally velocity are valid. It may also include GNSS-network time relationship, if requested by the location server and supported by the target device.</p>  |
| <p><b>agnss-List</b><br/>This field provides a list of satellite systems used by the target device to calculate the location estimate and velocity estimate, if included. This is represented by a bit string in <i>GNSS-ID-Bitmap</i>, with a one-value at the bit position means the particular method has been used; a zero-value means not used.</p> |

## 6.5.2.7 GNSS Location Information Request

### – A-GNSS-RequestLocationInformation

The IE *A-GNSS-RequestLocationInformation* is used by the location server to request location information from the target device using GNSS.

```
-- ASN1START
A-GNSS-RequestLocationInformation ::= SEQUENCE {
    gnss-PositioningInstructions    GNSS-PositioningInstructions,
    ...
}
-- ASN1STOP
```

## 6.5.2.8 GNSS Location Information Request Elements

### – GNSS-PositioningInstructions

The IE *GNSS-PositioningInstructions* is used to provide GNSS measurement instructions.

```
-- ASN1START
GNSS-PositioningInstructions ::= SEQUENCE {
    gnss-Methods                GNSS-ID-Bitmap,
    fineTimeAssistanceMeasReq   BOOLEAN,
    adrMeasReq                  BOOLEAN,
    multiFreqMeasReq           BOOLEAN,
    assistanceAvailability      BOOLEAN,
    ...
}
-- ASN1STOP
```

| <b>GNSS-PositioningInstructions field descriptions</b>   |
|--|
| <p><b>gnssMethods</b><br/>This field indicates the satellite systems allowed by the location server. This is represented by a bit string in <i>GNSS-ID-Bitmap</i>, with a one-value at the bit position means the particular GNSS is allowed; a zero-value means not allowed. The target device shall not request assistance data or report or obtain measurements for systems that are not indicated in this bit map. At least one of the bits in this bit map shall be set to value one.</p> |
| <p><b>fineTimeAssistanceMeasReq</b><br/>This field indicates whether the target device is requested to report GNSS-network time association. TRUE means requested.</p>   |
| <p><b>adrMeasReq</b><br/>This field indicates whether the target device is requested to include ADR measurements in <i>GNSS-MeasurementList</i> IE or not. TRUE means requested.</p>   |
| <p><b>multiFreqMeasReq</b><br/>This field indicates whether the target device is requested to report measurements on multiple supported GNSS signal types in <i>GNSS-MeasurementList</i> IE or not. TRUE means requested.</p>  |
| <p><b>assistanceAvailability</b><br/>This field indicates whether the target device may request additional GNSS assistance data from the server. TRUE means allowed and FALSE means not allowed.</p>   |

### 6.5.2.9 GNSS Capability Information

#### – A-GNSS-ProvideCapabilities

The IE *A-GNSS-Provide-Capabilities* is used by the target device to indicate its capability to support A-GNSS and to provide it's A-GNSS location capabilities (e.g., GNSSs and assistance data supported) to the location server.

```

-- ASN1START
A-GNSS-ProvideCapabilities ::= SEQUENCE {
    gnss-SupportList          GNSS-SupportList          OPTIONAL,
    assistanceDataSupportList AssistanceDataSupportList OPTIONAL,
    locationCoordinateTypes   LocationCoordinateTypes OPTIONAL,
    velocityTypes             VelocityTypes             OPTIONAL,
    ...
}

GNSS-SupportList ::= SEQUENCE (SIZE(1..16)) OF GNSS-SupportElement

GNSS-SupportElement ::= SEQUENCE {
    gnss-ID                  GNSS-ID,
    sbas-IDs                 SBAS-IDs                OPTIONAL,    -- Cond GNSS-ID-SBAS
    agnss-Modes              PositioningModes,
    gnss-Signals             GNSS-SignalIDs,
    fta-MeasSupport         SEQUENCE {
        cellTime             AccessTypes,
        mode                 PositioningModes,
        ...
    } OPTIONAL,    -- Cond fta
    adr-Support              BOOLEAN,
    velocityMeasurementSupport BOOLEAN,
    ...
}

AssistanceDataSupportList ::= SEQUENCE {
    gnss-CommonAssistanceDataSupport GNSS-CommonAssistanceDataSupport,
    gnss-GenericAssistanceDataSupport GNSS-GenericAssistanceDataSupport,
    ...
}

-- ASN1STOP

```

| Conditional presence | Explanation   |
|----------------------|---|
| <i>GNSS-ID-SBAS</i>  | The field is mandatory present if the <i>GNSS-ID = sbas</i> ; otherwise it is not present.  |
| <i>fta</i>           | The field is mandatory present if the target device supports the reporting of fine time assistance measurements; otherwise it is not present. |

| <b>A-GNSS-ProvideCapabilities field descriptions</b> |  |
|--|--|
| <b><i>gnss-SupportList</i></b>                       | This field specifies the list of GNSS supported by the target device and the target device capabilities associated with each of the supported GNSS. This field shall be present if the <i>gnss-SupportListReq</i> in the A-GNSS - <i>RequestCapabilities</i> IE is set to TRUE and if the target device supports the A-GNSS positioning method. If the IE <i>A-GNSS-Provide-Capabilities</i> is provided unsolicited, this field shall be included if the target device supports the assisted GNSS positioning method. |
| <b><i>gnss-ID</i></b>                                | This field specifies the GNSS supported by the target device for which the capabilities in <i>GNSS-SupportElement</i> are provided.  |
| <b><i>sbas-IDs</i></b>                               | This field specifies the SBAS(s) supported by the target device. This is represented by a bit string, with a one-value at the bit position means the particular SBAS is supported; a zero-value means not supported.   |
| <b><i>agnss-Modes</i></b>                            | This field specifies the GNSS mode(s) supported by the target device for the GNSS indicated by <i>gnss-ID</i> . This is represented by a bit string, with a one-value at the bit position means the particular GNSS mode is supported; a zero-value means not supported.   |
| <b><i>gnss-Signals</i></b>                           | This field specifies the GNSS signal(s) supported by the target device for the GNSS indicated by <i>gnss-ID</i> . This is represented by a bit string, with a one-value at the bit position means the particular GNSS signal type is supported; a zero-value means not supported.  |

| <b>A-GNSS-ProvideCapabilities field descriptions</b>  |
|---|
| <p><b>fta-MeasSupport</b><br/>This field specifies that the target device is capable of performing fine time assistance measurements (i.e., GNSS-cellular time association reporting). The <i>cellTime</i> field specifies for which cellular network(s) this capability is supported. This is represented by a bit string, with a one-value at the bit position means FTA measurements for the specific cellular network time is supported; a zero-value means not supported. The <i>mode</i> field specifies for which GNSS mode(s) FTA measurements are supported by the target device. This is represented by a bit string, with a one-value at the bit position means FTA measurements for the GNSS mode is supported; a zero-value means not supported.</p> |
| <p><b>adr-Support</b><br/>This field specifies whether the target device supports ADR measurement reporting. TRUE means supported.</p>  |
| <p><b>velocityMeasurementSupport</b><br/>This field specifies whether the target device supports measurement reporting related to velocity. TRUE means supported.</p>   |
| <p><b>assistanceDataSupportList</b><br/>This list defines the assistance data and assistance data choices supported by the target device. This field shall be present if the <i>assistanceDataSupportListReq</i> in the A-GNSS-RequestCapabilities IE is set to TRUE and if the target device supports GNSS assistance data. If the IE A-GNSS-Provide-Capabilities is provided unsolicited, this field shall be included if the target device supports any GNSS assistance data.</p>  |
| <p><b>locationCoordinateTypes</b><br/>This parameter identifies the geographical location coordinate types that a target device supports for GNSS. TRUE indicates that a location coordinate type is supported and FALSE that it is not. This field shall be present if the <i>locationVelocityTypesReq</i> in the A-GNSS-RequestCapabilities IE is set to TRUE and if the target device supports UE-based or standalone GNSS positioning method. If the IE A-GNSS-Provide-Capabilities is provided unsolicited, this field shall be included if the target device supports UE-based or standalone GNSS positioning method.</p>   |
| <p><b>velocityTypes</b><br/>This parameter identifies the velocity types that a target device supports for GNSS. TRUE indicates that a velocity type is supported and FALSE that it is not. FALSE for all velocity types indicates that velocity reporting is not supported. This field shall be present if the <i>locationVelocityTypesReq</i> in the A-GNSS-RequestCapabilities IE is set to TRUE and if the target device supports UE-based or standalone GNSS positioning method. If the IE A-GNSS-Provide-Capabilities is provided unsolicited, this field shall be included if the target device supports UE-based or standalone GNSS positioning method.</p>   |

## 6.5.2.10 GNSS Capability Information Elements

### – GNSS-CommonAssistanceDataSupport

The IE *GNSS-CommonAssistanceDataSupport* is used by the target device to provide information on supported GNSS common assistance data types to the location server.

```
-- ASN1START
GNSS-CommonAssistanceDataSupport ::= SEQUENCE {
    gnss-ReferenceTimeSupport          GNSS-ReferenceTimeSupport
                                     OPTIONAL, -- Cond RefTimeSup
    gnss-ReferenceLocationSupport      GNSS-ReferenceLocationSupport
                                     OPTIONAL, -- Cond RefLocSup
    gnss-IonosphericModelSupport       GNSS-IonosphericModelSupport
                                     OPTIONAL, -- Cond IonoModSup
    gnss-EarthOrientationParametersSupport GNSS-EarthOrientationParametersSupport
                                     OPTIONAL, -- Cond EOPSup
    ...
}
-- ASN1STOP
```

| <b>Conditional presence</b> | <b>Explanation</b>  |
|-----------------------------|---|
| <i>RefTimeSup</i>           | The field is mandatory present if the target device supports <i>GNSS-ReferenceTime</i> ; otherwise it is not present.               |
| <i>RefLocSup</i>            | This field is mandatory present if the target device supports <i>GNSS-ReferenceLocation</i> ; otherwise it is not present.          |
| <i>IonoModSup</i>           | This field is mandatory present if the target device supports <i>GNSS-IonosphericModel</i> ; otherwise it is not present.           |
| <i>EOPSup</i>               | This field is mandatory present if the target device supports <i>GNSS-EarthOrientationParameters</i> ; otherwise it is not present. |

## – GNSS-ReferenceTimeSupport

```
-- ASN1START
GNSS-ReferenceTimeSupport ::= SEQUENCE {
    gnss-SystemTime    GNSS-ID-Bitmap,
    fta-Support        AccessTypes                                OPTIONAL, -- Cond fta
    ...
}
-- ASN1STOP
```

| Conditional presence | Explanation  |
|----------------------|--|
| <i>fta</i>           | The field is mandatory present if the target device supports fine time assistance in <i>GNSSReferenceTime</i> IE; otherwise it is not present. |

### GNSS-ReferenceTimeSupport field descriptions

#### ***gnss-SystemTime***

This field specifies the GNSS system time(s) supported by the target device. This is represented by a bit string in *GNSS-ID-Bitmap*, with a one-value at the bit position means the particular GNSS system time is supported; a zero-value means not supported.

#### ***fta-Support***

This field specifies that the target device supports fine time assistance (i.e., GNSS-cellular time association) in *GNSS-ReferenceTime* IE. This is represented by a bit string in *AccessTypes*, with a one-value at the bit position means FTA for the specific cellular network time is supported; a zero-value means not supported.

## – GNSS-ReferenceLocationSupport

```
-- ASN1START
GNSS-ReferenceLocationSupport ::= SEQUENCE {
    ...
}
-- ASN1STOP
```

## – GNSS-IonosphericModelSupport

```
-- ASN1START
GNSS-IonosphericModelSupport ::= SEQUENCE {
    ionoModel          BIT STRING {
        klobuchar      (0),
        neQuick        (1) } (SIZE (1..8)),
    ...
}
-- ASN1STOP
```

### GNSS-IonosphericModelSupport field descriptions

#### ***ionoModel***

This field specifies the ionospheric model(s) supported by the target device. This is represented by a bit string, with a one-value at the bit position means the particular ionospheric model is supported; a zero-value means not supported.

## – GNSS-EarthOrientationParametersSupport

```
-- ASN1START
GNSS-EarthOrientationParametersSupport ::= SEQUENCE {
    ...
}
-- ASN1STOP
```

## – GNSS-GenericAssistanceDataSupport

The IE *GNSS-GenericAssistanceDataSupport* is used by the target device to provide information on supported GNSS generic assistance data types to the location server for each supported GNSS.

```
-- ASN1START
GNSS-GenericAssistanceDataSupport ::=
    SEQUENCE (SIZE (1..16)) OF GNSS-GenericAssistDataSupportElement
GNSS-GenericAssistDataSupportElement ::= SEQUENCE {
    gnss-ID                GNSS-ID,
    sbas-ID                SBAS-ID                               OPTIONAL, -- Cond GNSS-ID-SBAS
    gnss-TimeModelsSupport GNSS-TimeModelListSupport          OPTIONAL, -- Cond TimeModSup
    gnss-DifferentialCorrectionsSupport GNSS-DifferentialCorrectionsSupport
                                                                OPTIONAL, -- Cond DGNSS-Sup
    gnss-NavigationModelSupport GNSS-NavigationModelSupport
                                                                OPTIONAL, -- Cond NavModSup
    gnss-RealTimeIntegritySupport GNSS-RealTimeIntegritySupport
                                                                OPTIONAL, -- Cond RTISup
    gnss-DataBitAssistanceSupport GNSS-DataBitAssistanceSupport
                                                                OPTIONAL, -- Cond DataBitsSup
    gnss-AcquisitionAssistanceSupport GNSS-AcquisitionAssistanceSupport
                                                                OPTIONAL, -- Cond AcquAssistSup
    gnss-AlmanacSupport     GNSS-AlmanacSupport
                                                                OPTIONAL, -- Cond AlmanacSup
    gnss-UTC-ModelSupport   GNSS-UTC-ModelSupport
                                                                OPTIONAL, -- Cond UTCModSup
    gnss-AuxiliaryInformationSupport GNSS-AuxiliaryInformationSupport
                                                                OPTIONAL, -- Cond AuxInfoSup
    ...
    [
        bds-DifferentialCorrectionsSupport-r12 BDS-DifferentialCorrectionsSupport-r12
                                                                OPTIONAL, -- Cond DBDS-Sup
        bds-GridModelSupport-r12             BDS-GridModelSupport-r12
                                                                OPTIONAL -- Cond BDS-GridModSup
    ]
}
-- ASN1STOP
```

| Conditional presence  | Explanation  |
|-----------------------|--|
| <i>GNSS-ID-SBAS</i>   | The field is mandatory present if the <i>GNSS-ID</i> = <i>sbas</i> ; otherwise it is not present.  |
| <i>TimeModSup</i>     | The field is mandatory present if the target device supports <i>GNSS-TimeModelList</i> ; otherwise it is not present.  |
| <i>DGNSS-Sup</i>      | The field is mandatory present if the target device supports <i>GNSS-DifferentialCorrections</i> ; otherwise it is not present.  |
| <i>NavModSup</i>      | The field is mandatory present if the target device supports <i>GNSS-NavigationModel</i> ; otherwise it is not present.  |
| <i>RTISup</i>         | The field is mandatory present if the target device supports <i>GNSS-RealTimeIntegrity</i> ; otherwise it is not present.  |
| <i>DataBitsSup</i>    | The field is mandatory present if the target device supports <i>GNSS-DataBitAssistance</i> ; otherwise it is not present.  |
| <i>AcquAssistSup</i>  | The field is mandatory present if the target device supports <i>GNSS-AcquisitionAssistance</i> ; otherwise it is not present.  |
| <i>AlmanacSup</i>     | The field is mandatory present if the target device supports <i>GNSS-Almanac</i> ; otherwise it is not present.  |
| <i>UTCModSup</i>      | The field is mandatory present if the target device supports <i>GNSS-UTC-Model</i> ; otherwise it is not present.  |
| <i>AuxInfoSup</i>     | The field is mandatory present if the target device supports <i>GNSS-AuxiliaryInformation</i> ; otherwise it is not present.   |
| <i>DBDS-Sup</i>       | The field is mandatory present if the target device supports <i>BDS-DifferentialCorrections</i> ; otherwise it is not present. This field may only be present if <i>gnss-ID</i> indicates "bds". |
| <i>BDS-GridModSup</i> | The field is mandatory present if the target device supports <i>BDS-GridModel</i> ; otherwise it is not present. This field may only be present if <i>gnss-ID</i> indicates "bds".               |

## – GNSS-TimeModelListSupport

```
-- ASN1START
GNSS-TimeModelListSupport ::= SEQUENCE {
    ...
}
-- ASN1STOP
```

## – GNSS-DifferentialCorrectionSupport

```
-- ASN1START
GNSS-DifferentialCorrectionsSupport ::= SEQUENCE {
    gnssSignalIDs          GNSS-SignalIDs,
    dgnss-ValidityTimeSup  BOOLEAN,
    ...
}
-- ASN1STOP
```

### GNSS-DifferentialCorrectionsSupport field descriptions

#### **gnssSignalIDs**

This field specifies the GNSS signal types for which differential corrections are supported by the target device. This is represented by a bit string in *GNSS-SignalIDs*, with a one-value at the bit position means differential corrections for the particular GNSS signal type is supported; a zero-value means not supported.

#### **dgnss-ValidityTimeSup**

This field specifies if the target device supports estimation of UDRE based on growth rate and validity time for differential corrections. TRUE means supported.

## – GNSS-NavigationModelSupport

```
-- ASN1START
GNSS-NavigationModelSupport ::= SEQUENCE {
    clockModel      BIT STRING {
        model-1      (0),
        model-2      (1),
        model-3      (2),
        model-4      (3),
        model-5      (4),
        model-6      (5) } (SIZE (1..8)) OPTIONAL,
    orbitModel      BIT STRING {
        model-1      (0),
        model-2      (1),
        model-3      (2),
        model-4      (3),
        model-5      (4),
        model-6      (5) } (SIZE (1..8)) OPTIONAL,
    ...
}
-- ASN1STOP
```

### GNSS-NavigationModelSupport field descriptions

**GNSS-NavigationModelSupport field descriptions****clockModel**

This field specifies the *gnss-ClockModel* choice(s) in *GNSS-NavigationModel* IE supported by the target device for the GNSS indicated by *GNSS-ID*. This is represented by a bit string, with a one-value at the bit position means the particular clock model is supported; a zero-value means not supported.

If the target device supports GPS and *GNSS-NavigationModel* assistance, it shall support *clockModel* Model-2.

If the target device supports SBAS and *GNSS-NavigationModel* assistance, it shall support *clockModel* Model-5.

If the target device supports QZSS and *GNSS-NavigationModel* assistance, it shall support *clockModel* Model-2.

If the target device supports Galileo and *GNSS-NavigationModel* assistance, it shall support *clockModel* Model-1.

If the target device supports GLONASS and *GNSS-NavigationModel* assistance, it shall support *clockModel* Model-4.

If the target device supports BDS and *GNSS-NavigationModel* assistance, it shall support *clockModel* Model-6.

If this field is absent, the target device supports the mandatory (native) *clockModel* choice only as listed above for the GNSS indicated by *GNSS-ID*.

**orbitModel**

This field specifies the *gnss-OrbitModel* choice(s) in *GNSS-NavigationModel* IE supported by the target device for the GNSS indicated by *GNSS-ID*. This is represented by a bit string, with a one-value at the bit position means the particular orbit model is supported; a zero-value means not supported.

If the target device supports GPS and *GNSS-NavigationModel* assistance, it shall support *orbitModel* Model-2.

If the target device supports SBAS and *GNSS-NavigationModel* assistance, it shall support *orbitModel* Model-5.

If the target device supports QZSS and *GNSS-NavigationModel* assistance, it shall support *orbitModel* Model-2.

If the target device supports Galileo and *GNSS-NavigationModel* assistance, it shall support *orbitModel* Model-1.

If the target device supports GLONASS and *GNSS-NavigationModel* assistance, it shall support *orbitModel* Model-4.

If the target device supports BDS and *GNSS-NavigationModel* assistance, it shall support *orbitModel* Model-6.

If this field is absent, the target device supports the mandatory (native) *orbitModel* choice only as listed above for the GNSS indicated by *GNSS-ID*.

**GNSS-RealTimeIntegritySupport**

```
-- ASN1START
GNSS-RealTimeIntegritySupport ::= SEQUENCE {
    ...
}
-- ASN1STOP
```

**GNSS-DataBitAssistanceSupport**

```
-- ASN1START
GNSS-DataBitAssistanceSupport ::= SEQUENCE {
    ...
}
-- ASN1STOP
```

**GNSS-AcquisitionAssistanceSupport**

```
-- ASN1START
GNSS-AcquisitionAssistanceSupport ::= SEQUENCE {
    ...
    confidenceSupport-r10          ENUMERATED { true }    OPTIONAL,
    dopplerUncertaintyExtSupport-r10  ENUMERATED { true }    OPTIONAL
}
-- ASN1STOP
```

**GNSS-AcquisitionAssistanceSupport field descriptions****confidenceSupport**

If this field is present, the target device supports the *confidence* field in *GNSS-AcquisitionAssistance*.

**dopplerUncertaintyExtSupport**

If this field is present, the target device supports the *dopplerUncertaintyExt* field in *GNSS-AcquisitionAssistance*.

## – GNSS-AlmanacSupport

```
-- ASN1START
GNSS-AlmanacSupport ::= SEQUENCE {
  almanacModel BIT STRING {
    model-1 (0),
    model-2 (1),
    model-3 (2),
    model-4 (3),
    model-5 (4),
    model-6 (5),
    model-7 (6) } (SIZE (1..8)) OPTIONAL,
  ...
}
-- ASN1STOP
```

### GNSS-AlmanacSupport field descriptions

#### **almanacModel**

This field specifies the *almanacModel* choice(s) in *GNSS-Almanac* IE supported by the target device for the GNSS indicated by *GNSS-ID*. This is represented by a bit string, with a one-value at the bit position means the particular almanac model is supported; a zero-value means not supported.

If the target device supports GPS and *GNSS-Almanac* assistance, it shall support Model-2.

If the target device supports SBAS and *GNSS-Almanac* assistance, it shall support Model-6.

If the target device supports QZSS and *GNSS-Almanac* assistance, it shall support Model-2.

If the target device supports Galileo and *GNSS-Almanac* assistance, it shall support Model-1.

If the target device supports GLONASS and *GNSS-Almanac* assistance, it shall support Model-5.

If the target device supports BDS and *GNSS-Almanac* assistance, it shall support Model-7.

If this field is absent, the target device supports the mandatory (native) *almanacModel* choice only as listed above for the GNSS indicated by *GNSS-ID*.

## – GNSS-UTC-ModelSupport

```
-- ASN1START
GNSS-UTC-ModelSupport ::= SEQUENCE {
  utc-Model BIT STRING {
    model-1 (0),
    model-2 (1),
    model-3 (2),
    model-4 (3),
    model-5 (4) } (SIZE (1..8)) OPTIONAL,
  ...
}
-- ASN1STOP
```

### GNSS-UTC-ModelSupport field descriptions

#### **utc-Model**

This field specifies the *GNSS-UTC-Model* choice(s) in *GNSS-UTC-Model* IE supported by the target device for the GNSS indicated by *GNSS-ID*. This is represented by a bit string, with a one-value at the bit position means the particular UTC model is supported; a zero-value means not supported.

If the target device supports GPS and *GNSS-UTC-Model* assistance, it shall support Model-1.

If the target device supports SBAS and *GNSS-UTC-Model* assistance, it shall support Model-4.

If the target device supports QZSS and *GNSS-UTC-Model* assistance, it shall support Model-1.

If the target device supports Galileo and *GNSS-UTC-Model* assistance, it shall support Model-1.

If the target device supports GLONASS and *GNSS-UTC-Model* assistance, it shall support Model-3.

If the target device supports BDS and *GNSS-UTC-Model* assistance, it shall support Model-5.

If this field is absent, the target device supports the mandatory (native) *utc-Model* choice only as listed above for the GNSS indicated by *GNSS-ID*.

## – GNSS-AuxiliaryInformationSupport

```
-- ASN1START
GNSS-AuxiliaryInformationSupport ::= SEQUENCE {
  ...
}
```

```
}
-- ASN1STOP
```

## – BDS-DifferentialCorrectionsSupport

```
-- ASN1START
BDS-DifferentialCorrectionsSupport-r12 ::= SEQUENCE {
    gnssSignalIDs          GNSS-SignalIDs,
    ...
}
-- ASN1STOP
```

### **BDS-DifferentialCorrectionsSupport** field descriptions

#### ***gnssSignalIDs***

This field specifies the BDS signal types for which differential corrections are supported by the target device. This is represented by a bit string in *GNSS-SignalIDs*, with a one-value at the bit position means differential corrections for the particular BDS signal type is supported; a zero-value means not supported.

## – BDS-GridModelSupport

```
-- ASN1START
BDS-GridModelSupport-r12 ::= SEQUENCE {
    ...
}
-- ASN1STOP
```

## 6.5.2.11 GNSS Capability Information Request

### – A-GNSS-RequestCapabilities

The IE *A-GNSS-Request-Capabilities* is used by the location server to request A-GNSS location capabilities (e.g., GNSSs and assistance data supported) from the target device.

```
-- ASN1START
A-GNSS-RequestCapabilities ::= SEQUENCE {
    gnss-SupportListReq          BOOLEAN,
    assistanceDataSupportListReq  BOOLEAN,
    locationVelocityTypesReq     BOOLEAN,
    ...
}
-- ASN1STOP
```

### **A-GNSS-RequestCapabilities** field descriptions

#### ***gnss-SupportListReq***

This field specifies whether the target device is requested to include the *gnss-SupportList* field in the *A-GNSS-ProvideCapabilities* IE or not. TRUE means requested.

#### ***assistanceDataSupportListReq***

This field specifies whether the target device is requested to include the *assistanceDataSupportList* field in the *A-GNSS-ProvideCapabilities* IE or not. TRUE means requested.

#### ***locationVelocityTypesReq***

This field specifies whether the target device is requested to include the *locationCoordinateTypes* field and *velocityTypes* field in the *A-GNSS-ProvideCapabilities* IE or not. TRUE means requested.

## 6.5.2.12 GNSS Error Elements

### – A-GNSS-Error

The IE *A-GNSS-Error* is used by the location server or target device to provide GNSS error reasons.

```
-- ASN1START
A-GNSS-Error ::= CHOICE {
  locationServerErrorCauses      GNSS-LocationServerErrorCauses,
  targetDeviceErrorCauses       GNSS-TargetDeviceErrorCauses,
  ...
}
-- ASN1STOP
```

### – GNSS-LocationServerErrorCauses

The IE *GNSS-LocationServerErrorCauses* is used by the location server to provide GNSS error reasons to the target device.

```
-- ASN1START
GNSS-LocationServerErrorCauses ::= SEQUENCE {
  cause      ENUMERATED {
    undefined,
    undeliveredAssistanceDataIsNotSupportedByServer,
    undeliveredAssistanceDataIsSupportedButCurrentlyNotAvailableByServer,
    undeliveredAssistanceDataIsPartlyNotSupportedAndPartlyNotAvailableByServer,
    ...
  },
  ...
}
-- ASN1STOP
```

### – GNSS-TargetDeviceErrorCauses

The IE *GNSS-TargetDeviceErrorCauses* is used by the target device to provide GNSS error reasons to the location server.

```
-- ASN1START
GNSS-TargetDeviceErrorCauses ::= SEQUENCE {
  cause      ENUMERATED {
    undefined,
    thereWereNotEnoughSatellitesReceived,
    assistanceDataMissing,
    notAllRequestedMeasurementsPossible,
    ...
  },
  fineTimeAssistanceMeasurementsNotPossible      NULL      OPTIONAL,
  adrMeasurementsNotPossible                     NULL      OPTIONAL,
  multiFrequencyMeasurementsNotPossible          NULL      OPTIONAL,
  ...
}
-- ASN1STOP
```

#### **GNSS-TargetDeviceErrorCauses field descriptions**

##### **cause**

This field provides a GNSS specific error cause. If the cause value is "*notAllRequestedMeasurementsPossible*", the target device was not able to provide all requested GNSS measurements (but may be able to report a location estimate or location measurements). In this case, the target device should include any of the "*fineTimeAssistanceMeasurementsNotPossible*", "*adrMeasurementsNotPossible*", or "*multiFrequencyMeasurementsNotPossible*" fields, as applicable.

## 6.5.2.13 Common GNSS Information Elements

### – GNSS-ID

The IE *GNSS-ID* is used to indicate a specific GNSS.

```
-- ASN1START
GNSS-ID ::= SEQUENCE {
    gnss-id      ENUMERATED{ gps, sbas, qzss, galileo, glonass, ..., bds },
    ...
}
-- ASN1STOP
```

### – GNSS-ID-Bitmap

The IE *GNSS-ID-Bitmap* is used to indicate several GNSSs using a bit map.

```
-- ASN1START
GNSS-ID-Bitmap ::= SEQUENCE {
    gnss-ids      BIT STRING {
        gps      (0),
        sbas     (1),
        qzss     (2),
        galileo  (3),
        glonass  (4),
        bds      (5) } (SIZE (1..16)),
    ...
}
-- ASN1STOP
```

#### **GNSS-ID-Bitmap field descriptions**

##### ***gnss-ids***

This field specifies the GNSS(s). This is represented by a bit string, with a one-value at the bit position means the particular GNSS is addressed; a zero-value means not addressed.

### – GNSS-SignalID

The IE *GNSS-SignalID* is used to indicate a specific GNSS signal type. The interpretation of *GNSS-SignalID* depends on the *GNSS-ID*.

```
-- ASN1START
GNSS-SignalID ::= SEQUENCE {
    gnss-SignalID INTEGER (0 .. 7),
    ...
}
-- ASN1STOP
```

#### **GNSS-SignalID field descriptions**

##### ***gnss-SignalID***

This field specifies a particular GNSS signal. The interpretation of *gnss-SignalID* depends on the *GNSS-ID* and is as shown in the table System to Value & Explanation relation below.

**System to Value & Explanation relation**

| System  | Value | Explanation       |
|---------|-------|-------------------|
| GPS     | 0     | GPS L1 C/A        |
|         | 1     | GPS L1C           |
|         | 2     | GPS L2C           |
|         | 3     | GPS L5            |
|         | 4-7   | Reserved          |
| SBAS    | 0     | L1                |
|         | 1-7   | Reserved          |
| QZSS    | 0     | QZS-L1            |
|         | 1     | QZS-L1C           |
|         | 2     | QZS-L2C           |
|         | 3     | QZS-L5            |
|         | 4-7   | Reserved          |
| GLONASS | 0     | GLONASS G1        |
|         | 1     | GLONASS G2        |
|         | 2     | GLONASS G3        |
|         | 3-7   | Reserved          |
| Galileo | 0     | Galileo E1        |
|         | 1     | Galileo E5A       |
|         | 2     | Galileo E5B       |
|         | 3     | Galileo E6        |

**GNSS-SignalIDs**

The IE *GNSSSignal-IDs* is used to indicate several GNSS signals using a bit map. The interpretation of *GNSSSignal-IDs* depends on the *GNSS-ID*.

```

-- ASN1START
GNSS-SignalIDs ::= SEQUENCE {
    gnss-SignalIDs    BIT STRING (SIZE(8)),
    ...
}
-- ASN1STOP
    
```

**GNSS-SignalIDs field descriptions**

**gnss-SignalIDs**

This field specifies one or several GNSS signals using a bit map. A one-value at the bit position means the particular signal is addressed; a zero-value at the particular bit position means the signal is not addressed. The interpretation of the bit map in *gnssSignalIDs* depends on the *GNSS-ID* and is shown in the table below.

Unfilled table entries indicate no assignment and shall be set to zero.

**interpretation of the bit map in *gnssSignalIDs***

| GNSS    | Bit 1 (MSB) | Bit 2   | Bit 3   | Bit 4  | Bit 5   | Bit 6 | Bit 7 | Bit 8 (LSB) |
|---------|-------------|---------|---------|--------|---------|-------|-------|-------------|
| GPS     | L1 C/A      | L1C     | L2C     | L5     |         |       |       |             |
| SBAS    | L1          |         |         |        |         |       |       |             |
| QZSS    | QZS-L1      | QZS-L1C | QZS-L2C | QZS-L5 |         |       |       |             |
| GLONASS | G1          | G2      | G3      |        |         |       |       |             |
| Galileo | E1          | E5a     | E5b     | E6     | E5a+E5b |       |       |             |
| BDS     | B1I         |         |         |        |         |       |       |             |

## – SBAS-ID

The IE *SBAS-ID* is used to indicate a specific SBAS.

```
-- ASN1START
SBAS-ID ::= SEQUENCE {
  sbas-id      ENUMERATED { waas, egnos, msas, gagan, ...},
  ...
}
-- ASN1STOP
```

## – SBAS-IDs

The IE *SBAS-IDs* is used to indicate several SBASs using a bit map.

```
-- ASN1START
SBAS-IDs ::= SEQUENCE {
  sbas-IDs      BIT STRING {
    waas      (0),
    egnos     (1),
    msas      (2),
    gagan     (3) } (SIZE (1..8)),
  ...
}
-- ASN1STOP
```

### **SBAS-IDs field descriptions**

#### ***sbas-IDs***

This field specifies one or several SBAS(s) using a bit map. A one-value at the bit position means the particular SBAS is addressed; a zero-value at the particular bit position means the SBAS is not addressed.

## – SV-ID

The IE *SV-ID* is used to indicate a specific GNSS satellite. The interpretation of *SV-ID* depends on the *GNSS-ID*.

```
-- ASN1START
SV-ID ::= SEQUENCE {
  satellite-id  INTEGER(0..63),
  ...
}
-- ASN1STOP
```

### **SV-ID field descriptions**

#### ***satellite-id***

This field specifies a particular satellite within a specific GNSS. The interpretation of *satellite-id* depends on the *GNSS-ID* see the table below.

interpretation of *satellite-id*

| System  | Value of <i>satellite-id</i> | Interpretation of <i>satellite-id</i>                               |
|---------|------------------------------|---|
| GPS     | "0" – "62"<br>"63"           | Satellite PRN Signal No. 1 to 63<br>Reserved                        |
| SBAS    | "0" – "38"<br>"39" – "63"    | Satellite PRN Signal No. 120 to 158<br>Reserved                     |
| QZSS    | "0" – "4"<br>"5" – "63"      | Satellite PRN Signal No. 193 to 197<br>Reserved                     |
| GLONASS | "0" – "23"<br>"24" – "63"    | Slot Number 1 to 24<br>Reserved                                     |
| Galileo | "0" – "35"<br>"36" – "63"    | Code No. 1 to 36<br>Reserved  |
| BDS     | "0" – "36"<br>"37" – "63"    | Satellite ranging code number signal<br>No.1 to 37 [23]<br>Reserved |

### 6.5.3 Enhanced Cell ID Positioning

#### 6.5.3.1 E-CID Location Information

##### – ECID-ProvideLocationInformation

The IE *ECID-ProvideLocationInformation* is used by the target device to provide E-CID location measurements to the location server. It may also be used to provide ECID positioning specific error reason.

```
-- ASN1START
ECID-ProvideLocationInformation ::= SEQUENCE {
    ecid-SignalMeasurementInformation    ECID-SignalMeasurementInformation    OPTIONAL,
    ecid-Error                           ECID-Error                           OPTIONAL,
    ...
}
-- ASN1STOP
```

#### 6.5.3.2 E-CID Location Information Elements

##### – ECID-SignalMeasurementInformation

The IE *ECID-SignalMeasurementInformation* is used by the target device to provide various UE-measurements to the location server.

```
-- ASN1START
ECID-SignalMeasurementInformation ::= SEQUENCE {
    primaryCellMeasuredResults    MeasuredResultsElement    OPTIONAL,
    measuredResultsList           MeasuredResultsList,
    ...
}

MeasuredResultsList ::= SEQUENCE (SIZE(1..32)) OF MeasuredResultsElement

MeasuredResultsElement ::= SEQUENCE {
    physCellId        INTEGER (0..503),
    cellGlobalId      CellGlobalIdEUTRA-AndUTRA    OPTIONAL,
    arfcnEUTRA        ARFCN-ValueEUTRA,
    systemFrameNumber
                        BIT STRING (SIZE (10))    OPTIONAL,
    rsrp-Result       INTEGER (0..97)            OPTIONAL,
    rsrq-Result       INTEGER (0..34)            OPTIONAL,
    ue-RxTxTimeDiff  INTEGER (0..4095)          OPTIONAL,
    ...,
    [[ arfcnEUTRA-v9a0    ARFCN-ValueEUTRA-v9a0    OPTIONAL    -- Cond EARFCN-max
    ]]
}
-- ASN1STOP
```

```
-- ASN1STOP
```

| Conditional presence | Explanation  |
|----------------------|--|
| <i>EARFCN-max</i>    | The field is mandatory present if the corresponding <i>arfcnEUTRA</i> (i.e. without suffix) is set to <i>maxEARFCN</i> . Otherwise the field is not present. |

| <b>ECID-SignalMeasurementInformation field descriptions</b>  |
|--|
| <p><b>primaryCellMeasuredResults</b><br/>This field contains measurements for the primary cell, when the target device reports measurements for both primary cell and neighbour cells. This field shall be omitted when the target device reports measurements for the primary cell only, in which case the measurements the primary cell is reported in the <i>measuredResultsList</i>.</p> |
| <p><b>measuredResultsList</b><br/>This list contains the E-CID measurements for up to 32 cells.</p>  |
| <p><b>physCellId</b><br/>This field specifies the physical cell identity of the measured cell.</p>   |
| <p><b>cellGlobalId</b><br/>This field specifies cell global ID of the measured cell. The target device shall provide this field if it was able to determine the ECGI of the measured cell at the time of measurement.</p>  |
| <p><b>arfcnEUTRA</b><br/>This field specifies the ARFCN of the measured E-UTRA carrier frequency, as defined in [12]. In case the target device includes <i>arfcnEUTRA-v9a0</i>, the target device shall set the corresponding <i>arfcnEUTRA</i> (i.e. without suffix) to <i>maxEARFCN</i>.</p>  |
| <p><b>systemFrameNumber</b><br/>This field specifies the system frame number of the measured cell during which the measurements have been performed. The target device shall include this field if it was able to determine the SFN of the cell at the time of measurement.</p>  |
| <p><b>rsrp-Result</b><br/>This field specifies the reference signal received power (RSRP) measurement, as defined in [12],[17].</p>  |
| <p><b>rsrq-Result</b><br/>This field specifies the reference signal received quality (RSRQ) measurement, as defined in [12],[17].</p>  |
| <p><b>ue-RxTxTimeDiff</b><br/>This field specifies the UE Rx-Tx time difference measurement, as defined in [17]. It is provided only for measurements on the UE's primary cell.<br/>Measurement report mapping is according to 3GPP TS 36.133 [18].</p>  |

### 6.5.3.3 E-CID Location Information Request

#### – ECID-RequestLocationInformation

The IE *ECID-RequestLocationInformation* is used by the location server to request E-CID location measurements from a target device.

```
-- ASN1START
ECID-RequestLocationInformation ::= SEQUENCE {
    requestedMeasurements    BIT STRING {
        rsrpReq              (0),
        rsrqReq              (1),
        ueRxTxReq            (2) } (SIZE(1..8)),
    ...
}
-- ASN1STOP
```

| <b>ECID-RequestLocationInformation field descriptions</b>   |
|---|
| <p><b>requestedMeasurements</b><br/>This field specifies the E-CID measurements requested. This is represented by a bit string, with a one-value at the bit position means the particular measurement is requested; a zero-value means not requested.</p> |

### 6.5.3.4 E-CID Capability Information

#### – ECID-ProvideCapabilities

The IE *ECID-ProvideCapabilities* is used by the target device to indicate its capability to support E-CID and to provide its E-CID location capabilities to the location server.

```
-- ASN1START
ECID-ProvideCapabilities ::= SEQUENCE {
    ecid-MeasSupported BIT STRING {
        rsrpSup      (0),
        rsrqSup      (1),
        ueRxTxSup    (2) } (SIZE(1..8)),
    ...
}
-- ASN1STOP
```

#### ***ECID-Provide-Capabilities* field descriptions**

##### ***ecid-MeasSupported***

This field specifies the E-CID measurements supported by the target device. This is represented by a bit string, with a one-value at the bit position means the particular measurement is supported; a zero-value means not supported. A zero-value in all bit positions in the bit string means only the basic Cell ID positioning method is supported by the target device.

If the UE Rx-Tx time difference measurement is supported by the target device (i.e., *ueRxTxSup* field is set to one), it means that the UE supports the UE Rx-Tx time difference measurement reporting via both LPP signaling and RRC signalling.

If a target device doesn't support LPP, the E-SMLC may assume the target device can not report the UE Rx-Tx time difference measurement results via RRC signalling.

### 6.5.3.5 E-CID Capability Information Request

#### – ECID-RequestCapabilities

The IE *ECID-RequestCapabilities* is used by the location server to request E-CID positioning capabilities from a target device.

```
-- ASN1START
ECID-RequestCapabilities ::= SEQUENCE {
    ...
}
-- ASN1STOP
```

### 6.5.3.6 E-CID Error Elements

#### – ECID-Error

The IE *ECID-Error* is used by the location server or target device to provide E-CID error reasons to the target device or location server, respectively.

```
-- ASN1START
ECID-Error ::= CHOICE {
    locationServerErrorCauses ECID-LocationServerErrorCauses,
    targetDeviceErrorCauses  ECID-TargetDeviceErrorCauses,
    ...
}
-- ASN1STOP
```

## – ECID-LocationServerErrorCauses

The IE *ECID-LocationServerErrorCauses* is used by the location server to provide E-CID error reasons to the target device.

```
-- ASN1START
ECID-LocationServerErrorCauses ::= SEQUENCE {
  cause      ENUMERATED { undefined,
                        ...
  }
  ...
}
-- ASN1STOP
```

## – ECID-TargetDeviceErrorCauses

The IE *ECID-TargetDeviceErrorCauses* is used by the target device to provide E-CID error reasons to the location server.

```
-- ASN1START
ECID-TargetDeviceErrorCauses ::= SEQUENCE {
  cause      ENUMERATED { undefined,
                        requestedMeasurementNotAvailable,
                        notAllRequestedMeasurementsPossible,
                        ...
  },
  rsrpMeasurementNotPossible    NULL      OPTIONAL,
  rsrqMeasurementNotPossible    NULL      OPTIONAL,
  ueRxTxMeasurementNotPossible  NULL      OPTIONAL,
  ...
}
-- ASN1STOP
```

### ***ECID-TargetDeviceErrorCauses* field descriptions**

#### **cause**

This field provides a ECID specific error cause. If the cause value is "*notAllRequestedMeasurementsPossible*", the target device was not able to provide all requested ECID measurements (but may be able to provide some measurements). In this case, the target device should include any of the "*rsrpMeasurementNotPossible*", "*rsrqMeasurementNotPossible*", or "*ueRxTxMeasurementNotPossible*" fields, as applicable.

## – End of LPP-PDU-Definitions

```
-- ASN1START
END
-- ASN1STOP
```

## Annex A (informative): Change History

| Change history |             |           |      |     |  |        |        |
