## Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<http://webapp.etsi.org/IPR/home.asp>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

## Foreword

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under <http://webapp.etsi.org/key/queryform.asp>.

# Foreword

This Technical Specification has been produced by the 3<sup>rd</sup> Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

---

# 1 Scope

The present document defines the physical channels of the radio sub-system required to support the logical channels. For the Flexible Layer One, it defines the physical channels of the radio sub-system required to support the transport channels. It includes a description of the logical channels, transport channels and the definition of frequency hopping, TDMA frames, timeslots and bursts.

## 1.1 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

## 1.2 Abbreviations

Abbreviations used in the present document are listed in 3GPP TR 21.905.

---

# 2 General

The radio subsystem is required to support a certain number of logical channels that can be separated into two categories as defined in 3GPP TS 44.003:

- i) the traffic channels (TCH's);
- ii) the control channels.

More information is given about these logical channels in clause 3 which also defines a number of special channels used by the radio sub-system.

Clause 4 of this document describes the physical resource available to the radio sub-system, clause 5 defines physical channels based on that resource and clause 6 specifies how the logical channels shall be mapped onto physical channels. Figure 1 depicts this process.

With the Flexible Layer One (FLO), the radio subsystem is required to support transport channels (see 3GPP TR 45.902). Clause 8 of this document describes the mapping and multiplexing principles that are specific to FLO. Because FLO offers transport channels instead of logical channels, any reference to logical channels, with the exception of SACCH, does not apply to FLO. Otherwise, and unless otherwise stated, the multiplexing principles described in this document are equally applicable to FLO (e.g. physical resource and physical channels).

---

# 3 Logical channels

## 3.1 General

This subclause describes the logical channels that are supported by the radio subsystem.

## 3.2 Traffic channels

### 3.2.1 General

Traffic channels (TCH's) are intended to carry either encoded speech or user data in circuit switched mode. Five general forms of traffic channel are defined:

- i) Full rate traffic channel (TCH/F). This channel carries information at a gross rate of 22,8 kbit/s.
- ii) Half rate traffic channel (TCH/H). This channel carries information at a gross rate of 11,4 kbit/s.
- iii) Enhanced circuit switched full rate traffic channel (E-TCH/F). This channel carries information at a gross rate of 69,6 kbit/s including the stealing symbols.
- iv) 8-PSK full rate traffic channel (O-TCH/F). This channel carries information at a gross rate of 68,4 kbit/s.
- v) 8-PSK half rate traffic channel (O-TCH/H). This channel carries information at a gross rate of 34,2 kbit/s.

Packet data traffic channels (PDTCH's) are intended to carry user data in packet switched mode. For the purpose of this EN, any reference to traffic channel does not apply to PDTCH unless explicitly stated.

All traffic channels are bi-directional unless otherwise stated. Unidirectional downlink full rate channels, TCH/FD, are defined as the downlink part of the corresponding TCH/F.

Multiple full rate channels can be assigned to the same MS. This is referred to as multislot configurations, which is defined in subclause 6.4.2.1.

Multiple packet data traffic channels can be assigned to the same MS or, in the case of point-to-multipoint transmission, a group of MSs. This is referred to as multislot packet configurations, as defined in subclause 6.4.2.2 and subclause 6.4.2.3a.

A combination of a half rate traffic channel and a half rate packet data traffic channel on the same basic physical channel can be assigned to the same MS as defined in subclause 6.4.2.3.

A combination of a traffic channel and one or more full rate packet data traffic channels can be assigned to the same MS.

The specific traffic channels available in the categories of speech and user data are defined in the subclauses following.

### 3.2.2 Speech traffic channels

The following traffic channels are defined to carry encoded speech:

- i) full rate traffic channel for speech (TCH/FS);
- ii) half rate traffic channel for speech (TCH/HS);
- iii) enhanced full rate traffic channel for speech (TCH/EFSS);
- iv) adaptive full rate traffic channel for speech (TCH/AFSS);
- v) adaptive half rate traffic channel for speech (TCH/AHSS);
- vi) adaptive full rate traffic channel for wideband speech (TCH/WFS);
- vii) adaptive half rate 8PSK traffic channel for speech (O-TCH/AHSS);
- viii) adaptive full rate 8PSK traffic channel for wideband speech (O-TCH/WFS);
- ix) adaptive half rate 8PSK traffic channel for wideband speech (O-TCH/WHS).

### 3.2.3 Circuit switched data traffic channels

The following traffic channels are defined to carry user data:

- i) full rate traffic channel for 9,6 kbit/s user data (TCH/F9.6);
- ii) full rate traffic channel for 4,8 kbit/s user data (TCH/F4.8);
- iii) half rate traffic channel for 4,8 kbit/s user data (TCH/H4.8);
- iv) half rate traffic channel for  $\leq 2,4$  kbit/s user data (TCH/H2.4);
- v) full rate traffic channel for  $\leq 2,4$  kbit/s user data (TCH/F2.4);
- vi) full rate traffic channel for 14,4 kbit/s user data (TCH/F14.4);
- vii) enhanced circuit switched full rate traffic channel for 28,8 kbit/s user data (E-TCH/F28.8);
- viii) enhanced circuit switched full rate traffic channel for 32,0 kbit/s user data (E-TCH/F32.0);
- ix) enhanced circuit switched full rate traffic channel for 43.2 kbit/s user data (E-TCH/F43.2).

### 3.2.4 Packet data traffic channels (PDTCH)

A PDTCH/F corresponds to the resource assigned to a single MS or, in the case of point-to-multipoint transmission, to multiple MSs for user data transmission. In a Basic Transmission Time Interval (BTTI) configuration, a PDTCH/F is mapped onto one physical channel (see subclause 6.3.2.1). Due to the dynamic multiplexing onto the same physical channel of different logical channels (see subclause 6.3.2), a PDTCH/F in BTTI configuration carries information at an instantaneous bit rate ranging from 0 to a maximum value dependent on the modulation and on the symbol rate, as given in the following table.

Modulation	Maximum instantaneous bit rate (kbit/s) when using the normal symbol rate (see 3GPP TS 45.004)	Maximum instantaneous bit rate (kbit/s) when using the higher symbol rate (see 3GPP TS 45.004)
GMSK	22,8	-
QPSK	-	55,2
8-PSK	69,6	-
16QAM	92,8	110,4
32QAM	116,0	138,0

In a Reduced Transmission Time Interval (RTTI) configuration, a PDTCH/F is mapped onto two physical channels, i.e. a PDCH-pair (see subclause 6.3.2.1). A PDTCH/F in RTTI configuration carries information at an instantaneous bit rate ranging from 0 to a maximum value which is double the corresponding value for that modulation and the symbol rate.

A PDTCH/H corresponds to the resource assigned to a single MS on half a physical channel for user data transmission. The maximum instantaneous bit rate for a PDTCH/H is half that for a PDTCH/F. A PDTCH/H is only possible in a BTTI configuration if Fast Ack/Nack Reporting is not used (see 3GPP TS 44.060).

All packet data traffic channels are uni-directional, either uplink (PDTCH/U), for a mobile originated packet transfer or downlink (PDTCH/D) for a mobile terminated packet transfer.

In the case of point-to-multipoint transmission, a PDTCH/D can be used for communication with multiple MSs.

## 3.3 Control channels

### 3.3.1 General

Control channels are intended to carry signalling or synchronization data. Four categories of control channel are defined: broadcast, common, dedicated and CTS control channels. Specific channels within these categories are defined in the subclauses following.

### 3.3.2 Broadcast channels

#### 3.3.2.1 Frequency correction channels (FCCH and CFCCH)

The frequency correction channel carries information for frequency correction of the mobile station. It is required only for the operation of the radio sub-system. Different mapping is used for FCCH and COMPACT CFCCH (see clause 7).

#### 3.3.2.2 Synchronization channels

The synchronization channel carries information for frame synchronization of the mobile station and identification of a base transceiver station. It is required only for the operation of the radio sub-system. Different channels are used for SCH and COMPACT CSCH.

### 3.3.2.2.1 Synchronization channel (SCH)

Specifically the synchronization channel (SCH) shall contain two encoded parameters:

- a) Base transceiver station identity code (BSIC): 6 bits (before channel coding) consists of 3 bits of PLMN colour code with range 0 to 7 and 3 bits of BS colour code with range 0 to 7 as defined in 3GPP TS 23.003.
- b) Reduced TDMA frame number (RFN): 19 bits (before channel coding) =

$$T1 \text{ (11 bits) range 0 to 2047} = \text{FN div (26 x 51)}$$

$$T2 \text{ (5 bits) range 0 to 25} = \text{FN mod 26}$$

$$T3' \text{ (3 bits) range 0 to 4} = (T3 - 1) \text{ div } 10$$

where

$$T3 \text{ (6 bits) range 0 to 50} = \text{FN mod } 51$$

and

FN = TDMA frame number as defined in subclause 4.3.3.

3GPP TS 44.006 and 3GPP TS 44.018 specify the precise bit ordering, 3GPP TS 45.003 the channel coding of the above parameters and 3GPP TS 45.010 defines how the TDMA frame number can be calculated from T1, T2, and T3'.

### 3.3.2.2.2 COMPACT synchronization channel (CSCH)

The COMPACT packet synchronization channel CSCH shall contain two encoded parameters:

- a) Base transceiver station identity code (BSIC): 6 bits (before channel coding) consists of 3 bits of PLMN colour code with range 0 to 7 and 3 bits BS colour code with range 0 to 7 as defined in 3GPP TS 23.003.
- b) Reduced TDMA frame number (RFN): 19 bits (before channel coding) =

$$R1 \text{ (10 bits) range 0 to 1023} = \text{FN div (51 x 52)}$$

$$R2 \text{ (6 bits) range 0 to 50} = (\text{FN div } 52) \text{ mod } 51$$

$$TG \text{ (2 bits) range 0 to 3}$$

Reserved (1 bit)

where

FN = TDMA frame number as defined in subclause 4.3.3

and

TG = time group as defined in subclause 4.3.4.

3GPP TS 44.006 and 3GPP TS 44.018 specify the precise bit ordering, 3GPP TS 45.003 the channel coding of the above parameters and 3GPP TS 45.010 defines how the TDMA frame number can be calculated from R1 and R2.

### 3.3.2.3 Broadcast control channel (BCCH)

The broadcast control channel broadcasts general information on a base transceiver station per base transceiver station basis. Of the many parameters contained in the BCCH, the use of the following parameters, as defined in 3GPP TS 44.018 are referred to in subclause 6.5:

- a) CCCH\_CONF which indicates the organization of the common control channels:

From this parameter, the number of common control channels (BS\_CC\_CHANS) and whether or not CCCH or SDCCH are combined (BS\_CCCH\_SDCCH\_COMB = true or false) are derived as follows:

CCCH_CONF	BS_CC_CHANS	BS_CCCH_SDCCH_COMB
000	1	false
001	1	true
010	2	false
100	3	false
110	4	false

- b) BS\_AG\_BLK\_RES which indicates the number of blocks on each common control channel reserved for access grant messages:

3 bits (before channel coding) range 0 to 7.

- c) BS\_PA\_MFRMS which indicates the number of 51-multiframes between transmission of paging messages to mobiles of the same paging group:

3 bits (before channel coding) range 2 to 9.

- d) support of GPRS

The BCCH shall indicate whether or not packet switched traffic is supported. If packet switched traffic is supported and if the PBCCH exists, then the BCCH shall broadcast the position of the packet data channel (PDCH), as defined in subclause 6.3.2.1, carrying the PBCCH.

### 3.3.2.4 Packet Broadcast Control Channels

#### 3.3.2.4.1 Packet Broadcast Control Channel (PBCCH)

The PBCCH broadcasts parameters used by the MS to access the network for packet transmission operation. In addition to those parameters the PBCCH reproduces the information transmitted on the BCCH to allow circuit switched operation, such that a MS in GPRS attached mode monitors the PBCCH only, if it exists. The existence of the PBCCH in the cell is indicated on the BCCH. In the absence of PBCCH, the BCCH shall be used to broadcast information for packet operation.

Of the many parameters contained in the PBCCH, the use of the following parameters, as defined in 3GPP TS 44.060 are referred to in subclauses 6.5 and 6.3.2:

- BS\_PBCCH\_BLK (1,...,4) indicates the number of blocks allocated to the PBCCH in the multiframe (see subclause 6.3.2.3.3).
- BS\_PCC\_CHANS indicates the number of physical channels carrying PCCCHs including the physical channel carrying the PBCCH
- BS\_PAG\_BLK\_RES indicates the number of blocks on each PDCH carrying PCCCH per multiframe where neither PPCH nor PBCCH should appear (see subclause 6.3.2.3.4). The BS\_PAG\_BLK\_RES value shall fulfil the condition :  $BS\_PAG\_BLKS\_RES \leq 12 - BS\_PBCCH\_BLKS - 1$ .
- BS\_PRACH\_BLK indicates the number of blocks reserved in a fixed way to the PRACH channel on any PDCH carrying PCCCH (see subclause 6.3.2.2.3).

The PBCCH channel of a cell shall be allocated on the same frequency band (see 3GPP TS 45.005) as the BCCH channel of that cell.

#### 3.3.2.4.2 COMPACT Packet Broadcast Control Channel (CPBCCH)

The CPBCCH is a stand-alone packet control channel for COMPACT. The CPBCCH broadcasts parameters used by the MS to access the network for packet transmission operation.

Of the many parameters contained in the CPBCCH, the use of the following parameters, as defined in 3GPP TS 44.060 are referred to in subclauses 6.5 and 6.3.3:

- a) BS\_PBCCH\_BLKs (1,...,4) indicates the number of blocks allocated to the CPBCCH in the multiframe (see subclause 6.3.2.3.3a).
- b) BS\_PCC\_CHANS indicates the number of radio frequency channels per cell carrying CPCCCHs including the radio frequency channel carrying the CPBCCH.
- c) BS\_PAG\_BLKs\_RES indicates the number of blocks on each radio frequency channel carrying CPCCCH per multiframe where neither CPPCH nor CPBCCH should appear (see subclause 6.3.2.3.4a). BS\_PAG\_BLKs\_RES cannot be greater than 8.
- d) BS\_PRACH\_BLKs indicates the number of blocks reserved in a fixed way to the CPRACH channel on any radio frequency channel carrying CPCCCH (see subclause 6.3.2.2.3a).
- e) NIB\_CCCH\_0, NIB\_CCCH\_1, NIB\_CCCH\_2, and NIB\_CCCH\_3 indicate the number of downlink blocks per multiframe designated as idle to protect CPBCCH and CPCCCH blocks for non-serving time groups (see subclause 6.5.1).
- f) LARGE\_CELL\_OP indicates which type of cell size is used: nominal or large.

### 3.3.3 Common control type channels

#### 3.3.3.1 Common control type channels, known when combined as a common control channel (CCCH)

- i) Paging channel (PCH): Downlink only, used to page mobiles.
- ii) Random access channel (RACH): Uplink only, used to request assignment of a SDCCH.
- iii) Access grant channel (AGCH): Downlink only, used to assign a SDCCH or directly a TCH.
- iv) Notification channel (NCH): Downlink only, used to notify mobile stations of voice group and voice broadcast calls.

#### 3.3.3.2 Packet Common control channels

##### 3.3.3.2.1 Packet Common Control Channels (PCCCH)

- i) Packet Paging channel (PPCH): Downlink only, used to page MS.
- ii) Packet Random access channel (PRACH): Uplink only, used to request assignment of one or several PDTCHs (for uplink or downlink direction).
- iii) Packet Access grant channel (PAGCH): Downlink only, used to assign one or several PDTCH.

If a PCCCH is not allocated, the information for packet switched operation is transmitted on the CCCH. If a PCCCH is allocated, it may transmit information for circuit switched operation.

The PCCCH channel of a cell shall be allocated on the same frequency band (see 3GPP TS 45.005) as the BCCH channel of that cell.

##### 3.3.3.2.2 COMPACT Common Control Channels (CPCCCH)

- i) Packet Paging channel (CPPCH): Downlink only, used to page MS.
- ii) Packet Random access channel (CPRACH): Uplink only, used to request assignment of one or several PDTCHs (for uplink or downlink direction).
- iii) Packet Access grant channel (CPAGCH): Downlink only, used to assign one or several PDTCH.

### 3.3.3.2.3 MBMS Common Control Channels

- i) MBMS Packet Random access channel (MPRACH): Uplink only, used during the initial counting procedure for MBMS (see 3GPP TS 44.060).

## 3.3.4 Dedicated control channels

### 3.3.4.1 Circuit switched dedicated control channels

- i) Slow, TCH/F or E-TCH/F associated, control channel (SACCH/TF).
- ii) Fast, TCH/F associated, control channel (FACCH/F).
- iii) Slow, TCH/H or O-TCH/H associated, control channel (SACCH/TH).
- iv) Fast, TCH/H associated, control channel (FACCH/H).
- v) Stand alone dedicated control channel (SDCCH/8).
- vi) Slow, SDCCH/8 associated, control channel (SACCH/C8)
- vii) Stand alone dedicated control channel, combined with CCCH (SDCCH/4).
- viii) Slow, SDCCH/4 associated, control channel (SACCH/C4).
- ix) slow, TCH/F, O-TCH/F or E-TCH/F associated, control channel for multislot configurations (SACCH/M).
- x) slow, TCH/F associated, control channel for CTS (SACCH/CTS).
- xi) Fast, E-TCH/F associated, control channel (E-FACCH/F).
- xii) Inband, E-TCH/F associated, control channel (E-IACCH/F).
- xiii) Slow, TCH/F or O-TCH/F associated, control channel for enhanced power control (SACCH/TPF).
- xiv) Slow, TCH/F or O-TCH/F associated, control channel for enhanced power control in multislot configurations (SACCH/MP).
- xv) Slow, TCH/H or O-TCH/H associated, control channel for enhanced power control (SACCH/TPH).
- xvi) Enhanced power control, TCH/F or O-TCH/F associated channel (EPCCH/F).
- xvii) Enhanced power control, TCH/F or O-TCH/F associated channel in multislot configurations (EPCCH/M).
- xviii) Enhanced power control, TCH/H or O-TCH/H associated channel (EPCCH/H);
- xix) Fast, O-TCH/H associated, control channel (O-FACCH/H);
- xx) Fast, O-TCH/F associated, control channel (O-FACCH/F).

All associated control channels have the same direction (bi-directional or unidirectional) as the channels they are associated to. The unidirectional SACCH/MD, SACCH/MPD and EPCCH/MD are defined as the downlink part of SACCH/M, SACCH/MP and EPCCH/M respectively.

### 3.3.4.2 Packet dedicated control channels

- i) The Packet Associated Control channel (PACCH): The PACCH is bi-directional. For description purposes PACCH/U is used for the uplink and PACCH/D for the downlink. The PACCH shall be transmitted using the same configuration (BTTI or RTTI) of the PDTCH that it is associated with.
- ii) Packet Timing advance control channel uplink (PTCCH/U): Used to transmit random access bursts to allow estimation of the timing advance for one MS in packet transfer mode.
- iii) Packet Timing advance control channel downlink (PTCCH/D): Used to transmit timing advance updates for several MS. One PTCCH/D is paired with several PTCCH/U's.

### 3.3.5 Cell Broadcast Channel (CBCH)

The CBCH, downlink only, is used to carry the short message service cell broadcast (SMS-CB). The CBCH uses the same physical channel as the SDCCH.

### 3.3.6 CTS control channels

Four types of CTS control channels are defined:

#### 3.3.6.1 CTS beacon channel (BCH)

The BCH is used to provide frequency and synchronization information in the downlink. It is made up of a pair of CTSBCH-SB (Synchronization burst) and CTSBCH-FB (Frequency correction burst).

The CTSBCH-FB carries information for frequency correction of the mobile station. It is required only for the operation of the radio sub-system.

The CTSBCH-SB carries signalling information and identification of a CTS-FP. Specifically the CTSBCH-SB shall contain five encoded parameters:

- a) status of the CTS-FP radio resources : 1 bit (before channel coding);
- b) flag indicating the presence of CTSPCH in the next 52-multiframe : 1 bit (before channel coding);
- c) flag indicating whether the CTS-FP is currently performing timeslot shifting on CTSBCH: 1 bit (before channel coding);
- d) CTS control channels (except CTSBCH) timeslot number for the next 52-multiframe (TNC): 3 bits (before channel coding);
- e) CTS-FP beacon identity (FPBI) : 19 bits (before channel coding), as defined in 3GPP TS 23.003.

3GPP TS 44.056 specifies the precise bit ordering and 3GPP TS 45.003 the channel coding of the above parameters.

#### 3.3.6.2 CTS paging channel (CTSPCH)

Downlink only, used to broadcast information for paging.

#### 3.3.6.3 CTS access request channel (CTSARCH)

Uplink only, used to request assignment of a dedicated RR connection.

#### 3.3.6.4 CTS access grant channel (CTSAGCH)

Downlink only, used to grant a dedicated RR connection.

## 3.4 Combination of channels

Only certain combinations of channels are allowed as defined in 3GPP TS 44.003. Subclause 6.4 lists the combinations in relation to basic physical channels.

---

# 4 The physical resource

## 4.1 General

The physical resource available to the radio sub-system is an allocation of part of the radio spectrum. This resource is partitioned both in frequency and time. Frequency is partitioned by radio frequency channels (RFCHs) divided into

bands as defined in 3GPP TS 45.005. Time is partitioned by timeslots, TDMA frames, and (for COMPACT) time groups and 52-multiframe number as defined in subclause 4.3 of this EN.

## 4.2 Radio frequency channels

### 4.2.1 Cell allocation and mobile allocation

3GPP TS 45.005 defines radio frequency channels (RFCHs), and allocates numbers to all the radio frequency channels available to the system. Each cell is allocated a subset of these channels, defined as the cell allocation (CA). One radio frequency channel of the cell allocation shall be used to carry synchronization information and the BCCH, this shall be known as BCCH carrier. The subset of the cell allocation, allocated to a particular mobile, shall be known as the mobile allocation (MA).

For COMPACT, one radio frequency channel of the cell allocation shall be used to carry synchronization information and the CPBCCH, this shall be known as the primary COMPACT carrier. All other radio frequency channels of the cell allocation shall be known as secondary COMPACT carriers.

### 4.2.2 Downlink and uplink

The downlink comprises radio frequency channels used in the base transceiver station to Mobile Station direction.

The uplink comprises radio frequency channels used in the mobile station to base transceiver station direction.

## 4.3 Timeslots, TDMA frames, and time groups

### 4.3.1 General

A timeslot shall have a duration of  $\frac{3}{5} 200$  seconds ( $\approx 577 \mu\text{s}$ ). Eight timeslots shall form a TDMA frame ( $\approx 4,62$  ms in duration).

At the base transceiver station the TDMA frames on all of the radio frequency channels in the downlink shall be aligned. The same shall apply to the uplink (see 3GPP TS 45.010).

At the base transceiver station the start of a TDMA frame on the uplink is delayed by the fixed period of 3 timeslots from the start of the TDMA frame on the downlink (see figure 2).

At the mobile station this delay will be variable to allow adjustment for signal propagation delay. The process of adjusting this advance is known as adaptive frame alignment and is detailed in 3GPP TS 45.010.

The staggering of TDMA frames used in the downlink and uplink is in order to allow the same timeslot number to be used in the downlink and uplink whilst avoiding the requirement for the mobile station to transmit and receive simultaneously. The period includes time for adaptive frame alignment, transceiver tuning and receive/transmit switching (see figure 4).

### 4.3.2 Timeslot number

The timeslots within a TDMA frame shall be numbered from 0 to 7 and a particular timeslot shall be referred to by its timeslot number (TN).

### 4.3.3 TDMA frame number

TDMA frames shall be numbered by a frame number (FN). The frame number shall be cyclic and shall have a range of 0 to FN\_MAX where  $FN\_MAX = (26 \times 51 \times 2048) - 1 = 2715647$  as defined in 3GPP TS 45.010. For COMPACT,  $FN\_MAX = (52 \times 51 \times 1024) - 1 = 2715647$ . The frame number shall be incremented at the end of each TDMA frame.

The complete cycle of TDMA frame numbers from 0 to FN\_MAX is defined as a hyperframe. A hyperframe consists of 2048 superframes where a superframe is defined as 26 x 51 TDMA frames. For COMPACT, a hyperframe consists of 1024 superframes where a superframe is defined as 52 x 51 TDMA frames. A 26-multiframe, comprising 26 TDMA frames, is used to support traffic and associated control channels and a 51- multiframe, comprising 51 TDMA frames, is used to support broadcast, common control and stand alone dedicated control (and their associated control) channels. Hence a superframe may be considered as 51 traffic/associated control multiframes or 26 broadcast/common control multiframes. A 52-multiframe, comprising two 26-multiframes, is used to support packet data traffic and control channels.

The need for a hyperframe of a substantially longer period than a superframe arises from the requirements of the encryption process which uses FN as an input parameter.

### 4.3.4 Time group

Used for COMPACT, time groups shall be numbered from 0 to 3 and a particular time group shall be referred to by its time group number (TG) (see subclause 3.3.2.2.2). At block B0 and frame number (FN) mod 208 = 0, time group numbers (TG) are associated with timeslot numbers (TN) as follows:

TG	TN
0	1
1	3
2	5
3	7

For COMPACT, a cell is assigned one time group number (TG) on a primary COMPACT carrier. This is known as the serving time group. Other cells may be assigned other time groups on the same carrier.

---

## 5 Physical channels

### 5.1 General

A physical channel uses a combination of frequency and time division multiplexing and is defined as a sequence of radio frequency channels and time slots. The complete definition of a particular physical channel consists of a description in the frequency domain, and a description in the time domain.

The description in the frequency domain is addressed in subclause 5.4; the description in the time domain is addressed in subclause 5.5.

### 5.2 Bursts

#### 5.2.1 General

A burst is a period of RF carrier which is modulated by a data stream. A burst therefore represents the physical content of a timeslot.

## 5.2.2 Types of burst and burst timing

A timeslot is divided into 156,25 normal symbol periods or 187,5 reduced symbol periods (see 3GPP TS 45.010).

The modulating rate is assumed to be the normal symbol rate (see 3GPP TS 45.004) unless otherwise stated.

For GMSK modulation (see 3GPP TS 45.004) a symbol is equivalent to a bit. A particular bit period within a timeslot is referenced by a bit number (BN), with the first bit period being numbered 0, and the last (1/4) bit period being numbered 156.

For 8PSK modulation (see 3GPP TS 45.004) one symbol corresponds to three bits. A particular bit period within a timeslot is referenced by a bit number (BN), with the first bit being numbered 0, and the last (3/4) bit being numbered 468. The bits are mapped to symbols in ascending order according to 3GPP TS 45.004.

For 16QAM modulation (see 3GPP TS 45.004) one symbol corresponds to four bits. A particular bit period within a timeslot is referenced by a bit number (BN), with the first bit being numbered 0, and the last bit being numbered 624. When the modulating rate is the higher symbol rate, the last bit is numbered 749. The bits are mapped to symbols in ascending order according to 3GPP TS 45.004.

For 32QAM modulation (see 3GPP TS 45.004) one symbol corresponds to five bits. A particular bit period within a timeslot is referenced by a bit number (BN), with the first bit being numbered 0, and the last (1/4) bit being numbered 781. When the modulating rate is the higher symbol rate, the last (1/2) bit is numbered 937. The bits are mapped to symbols in ascending order according to 3GPP TS 45.004.

For QPSK modulation (see 3GPP TS 45.004) one symbol corresponds to two bits. A particular bit period within a timeslot is referenced by a bit number (BN), with the first bit being numbered 0, and the last bit being numbered 374. The bits are mapped to symbols in ascending order according to 3GPPTS45.004. QPSK modulation is used only at the higher symbol rate.

In the subclauses following, the transmission timing of a burst within a timeslot is defined in terms of bit number. The bit with the lowest bit number is transmitted first.

Different types of burst exist in the system. One characteristic of a burst is its useful duration. This document, in the subclauses following, defines full bursts of 147 normal symbol periods useful duration, full bursts of 176 reduced symbol periods useful duration (see 3GPP TS 45.010), and a short burst of 87 normal symbol periods useful duration. The useful part of a burst is defined as beginning from half way through symbol number 0. The definition of the useful part of a burst needs to be considered in conjunction with the requirements placed on the phase and amplitude characteristics of a burst as specified in 3GPP TS 45.004 and 45.005.

The period between bursts appearing in successive timeslots is termed the guard period. Subclause 5.2.8 details constraints which relate to the guard period.

## 5.2.3 Normal burst (NB)

### Normal burst for GMSK

Bit Number (BN)	Length of field	Contents of field	Definition
0 - 2	3	tail bits	(below)
3 - 60	58	encrypted bits (e0 . e57)	45.003
61 - 86	26	training sequence bits	(below)
87 - 144	58	encrypted bits (e58 . e115)	45.003
145 - 147	3	tail bits	(below)
(148 - 156)	8,25	guard period (bits)	subclause 5.2.8)

- where the "tail bits" are defined as modulating bits with states as follows:

(BN0, BN1, BN2) = (0, 0, 0) and

(BN145, BN146, BN147) = (0, 0, 0)

- where the "training sequence bits" are defined as modulating bits with states as given in the following table according to the training sequence code, TSC. For BCCH and CCCH, the TSC must be equal to the BCC, as defined in 3GPP TS 23.003. In networks supporting E-OTD Location services (see 3GPP TS 43.059), the TSC shall be equal to the BCC for all normal bursts on BCCH frequencies.

NOTE: For COMPACT, for PDTCH/PACCH on primary and secondary carriers that are indicated in EXT\_FREQUENCY\_LIST by parameter INT\_FREQUENCY and in INT\_MEAS\_CHAN\_LIST (see subclauses 10.1.5 and 10.2.3.2.2 of 3GPP TS 45.008), the TSCs should be equal to the BCC, as defined in 3GPP TS 23.003 and as described in this technical specification in subclause 3.3.2, otherwise the accuracy of interference measurement reporting may be compromised.

- For CTS control channels, the TSC shall be defined by the 3 LSBs (BN3, BN2, BN1) of the FPBI (specified in 3GPP TS 23.003).

Training Sequence Code (TSC)	Training sequence bits (BN61, BN62 .. BN86)
0	(0,0,1,0,0,1,0,1,1,1,0,0,0,0,1,0,0,0,1,0,0,1,0,0,1,0,1,1,1)
1	(0,0,1,0,1,1,0,1,1,1,0,1,1,1,1,0,0,0,1,0,1,1,0,1,1,0,1,1,1)
2	(0,1,0,0,0,0,1,1,1,0,1,1,1,0,1,0,0,1,0,0,0,0,1,1,1,0)
3	(0,1,0,0,0,1,1,1,1,0,1,1,0,1,0,0,0,1,0,0,0,1,1,1,1,0)
4	(0,0,0,1,1,0,1,0,1,1,1,0,0,1,0,0,0,0,0,1,1,0,1,0,1,1)
5	(0,1,0,0,1,1,1,0,1,0,1,1,0,0,0,0,0,1,0,0,1,1,1,0,1,0)
6	(1,0,1,0,0,1,1,1,1,1,0,1,1,0,0,0,1,0,1,0,0,1,1,1,1,1)
7	(1,1,1,0,1,1,1,1,0,0,0,1,0,0,1,0,1,1,1,0,1,1,1,0,1,1,0,0)

Under certain circumstances only half the encrypted bits present in a normal burst will contain complete information. For downlink DTX operation on TCH-FS and TCH-HS, when a traffic frame (as defined in 3GPP TS 46.031) is scheduled for transmission and one of its adjacent traffic frames is not scheduled for transmission, the other half of the encrypted bits in the normal bursts associated with the scheduled traffic frame shall contain partial SID information from any associated SID frame, with the appropriate stealing flags BN60 or BN87 set to 0. In other cases the binary state of the remaining bits is not specified.

### Normal burst for 8PSK

Bit Number (BN)	Length of field (bits)	Contents of field	Definition
0 – 8	9	tail bits	(below)
9 – 182	174	encrypted bits (e0 . e173)	45.003
183 – 260	78	training sequence bits	(below)
261 – 434	174	encrypted bits (e174 . e347)	45.003
435 – 443	9	tail bits	(below)
444 - 468	24.75	guard period	subclause 5.2.8

- where the "tail bits" are defined as modulating bits with states as follows (bits are grouped in symbols separated by ;):

(BN0, BN1 .. BN8) = (1,1,1;1,1,1;1,1,1) and

(BN435, BN436 .. BN443) = (1,1,1;1,1,1;1,1,1)

- where the "training sequence bits" are defined as modulating bits with states as given in the following table according to the training sequence code, TSC. For BCCH and CCCH, the TSC must be equal to the BCC, as defined in 3GPP TS 23.003. In networks supporting E-OTD Location services (see 3GPP TS 43.059), the TSC shall be equal to the BCC for all normal bursts on BCCH frequencies.

Training Sequence Code (TSC)	Training sequence symbols (BN183, BN184 .. BN260)
0	(1,1,1;1,1,1;0,0,1;1,1,1;1,1,1;0,0,1;1,1,1;0,0,1;0,0,1;0,0,1;1,1,1;1,1,1;1,1,1;1,1,1;0,0,1;1,1,1;1,1,1;1,1,1;0,0,1;1,1,1;0,0,1;1,1,1;0,0,1;1,1,1;0,0,1;0,0,1;0,0,1)
1	(1,1,1;1,1,1;0,0,1;1,1,1;0,0,1;1,1,1;0,0,1;1,1,1;0,0,1;0,0,1;1,1,1;0,0,1;0,0,1;0,0,1;0,0,1;1,1,1;1,1,1;1,1,1;0,0,1;1,1,1;0,0,1;1,1,1;0,0,1;1,1,1;0,0,1;0,0,1;0,0,1)
2	(1,1,1;0,0,1;1,1,1;1,1,1;1,1,1;1,1,1;0,0,1;0,0,1;0,0,1;1,1,1;0,0,1;0,0,1;0,0,1;1,1,1;0,0,1;1,1,1;1,1,1;0,0,1;1,1,1;1,1,1;0,0,1;1,1,1;1,1,1;0,0,1;0,0,1;0,0,1)
3	(1,1,1;0,0,1;1,1,1;1,1,1;1,1,1;0,0,1;0,0,1;0,0,1;0,0,1;1,1,1;0,0,1;0,0,1;1,1,1;0,0,1;0,0,1;1,1,1;0,0,1;1,1,1;1,1,1;0,0,1;1,1,1;1,1,1;0,0,1;1,1,1;0,0,1;1,1,1)
4	(1,1,1;1,1,1;1,1,1;0,0,1;0,0,1;1,1,1;0,0,1;1,1,1;0,0,1;1,1,1;0,0,1;0,0,1;0,0,1;1,1,1;1,1,1;1,1,1;0,0,1;1,1,1;0,0,1;1,1,1;0,0,1;1,1,1;0,0,1;1,1,1;0,0,1;1,1,1)
5	(1,1,1;0,0,1;1,1,1;1,1,1;0,0,1;0,0,1;0,0,1;1,1,1;0,0,1;1,1,1;0,0,1;1,1,1;0,0,1;0,0,1;1,1,1;1,1,1;1,1,1;0,0,1;1,1,1;0,0,1;1,1,1;0,0,1;1,1,1;0,0,1;1,1,1)

**Normal burst for 16QAM**

Bit Number (BN)	Length of field (bits)	Contents of field	Definition
0 – 11	12	tail bits	(below)
12 – 243	232	encrypted bits (e0 . e231)	45.003
244 – 347	104	training sequence bits	(below)
348 – 579	232	encrypted bits (e232 . e463)	45.003
580 – 591	12	tail bits	(below)
592 - 624	33	guard period	subclause 5.2.8

- where the "tail bits" are defined as modulating bits with states as follows (bits are grouped in symbols separated by ;):

(BN0, BN1 .. BN11) = ([tbd]) and  
 (BN580, BN581 .. BN591) = ([tbd])

- where the "training sequence bits" are defined as modulating bits with states as given in the following table according to the training sequence code, TSC. For BCCH and CCCH, the TSC must be equal to the BCC, as defined in 3GPP TS 23.003. In networks supporting E-OTD Location services (see 3GPP TS 43.059), the use of 16QAM modulation on BCCH frequencies might degrade E-OTD Location service performance.

Training Sequence Code (TSC)	Training sequence symbols (BN244, BN245 .. BN347)
0	(1,1,1,1;1,1,1,1;0,0,1,1;1,1,1,1;1,1,1,1;0,0,1,1;1,1,1,1;0,0,1,1;0,0,1,1;0,0,1,1;1,1,1,1;1,1,1,1;1,1,1,1;1,1,1,1;0,0,1,1;1,1,1,1;1,1,1,1;1,1,1,1;0,0,1,1;1,1,1,1;1,1,1,1;0,0,1,1;1,1,1,1;1,1,1,1;1,1,1,1;0,0,1,1;1,1,1,1;0,0,1,1;0,0,1,1;0,0,1,1)

**Normal burst for 32QAM**

Bit Number (BN)	Length of field (bits)	Contents of field	Definition
0 – 14	15	tail bits	(below)
15 – 304	290	encrypted bits (e0 . e289)	45.003
305 – 434	130	training sequence bits	(below)
435 – 724	290	encrypted bits (e290 . e579)	45.003
725 – 739	15	tail bits	(below)
740 - 781	41.25	guard period	Subclause 5.2.8

- where the "tail bits" are defined as modulating bits with states as follows (bits are grouped in symbols separated by ;):

$$(BN0, BN1 .. BN14) = ([tbd]) \quad \text{and}$$

$$(BN725, BN726 .. BN739) = ([tbd])$$

- where the "training sequence bits" are defined as modulating bits with states as given in the following table according to the training sequence code, TSC. For BCCH and CCCH, the TSC must be equal to the BCC, as defined in 3GPP TS 23.003. In networks supporting E-OTD Location services (see 3GPP TS 43.059), the use of 32QAM modulation on BCCH frequencies might degrade E-OTD Location service performance.

Training Sequence Code (TSC)	Training sequence symbols (BN305, BN306 .. BN434)
0	(0,0,0,0,0;0,0,0,0,0;1,0,0,1,0;0,0,0,0,0;0,0,0,0,0;1,0,0,1,0;0,0,0,0,0;1,0,0,1,0;1,0,0,1,0;1,0,0,1,0;0,0,0,0,0;0,0,0,0,0;0,0,0,0,0;0,0,0,0,0;1,0,0,1,0;0,0,0,0,0;0,0,0,0,0;0,0,0,0,0;1,0,0,1,0;0,0,0,0,0;0,0,0,0,0;1,0,0,1,0;1,0,0,1,0;1,0,0,1,0)

### 5.2.3a Higher symbol rate burst (HB)

#### Higher symbol rate burst for QPSK

Bit Number (BN)	Length of field (bits)	Contents of field	Definition
0 – 7	8	tail bits	(below)
8 – 145	138	encrypted bits (e0 . e137)	45.003
146 – 207	62	training sequence bits	(below)
208 – 345	138	encrypted bits (e138 . e275)	45.003
346 – 353	8	tail bits	(below)
354 - 374	21	guard period	Subclause 5.2.8

- where the "tail bits" are defined as modulating bits with states as follows (bits are grouped in symbols separated by ;):

(BN0, BN1 .. BN7) = (0,0;0,1;1,1;1,0) and

(BN346, BN347 .. BN353) = (0,0;0,1;1,1;1,0)

- where the "training sequence bits" are defined as modulating bits with states as given in the following table according to the training sequence code, TSC. For BCCH and CCCH, the TSC must be equal to the BCC, as defined in 3GPP TS 23.003. In networks supporting E-OTD Location services (see 3GPP TS 43.059), the use of QPSK modulation on BCCH frequencies might degrade E-OTD Location service performance.

Training Sequence Code (TSC)	Training sequence symbols (BN146, BN147 .. BN207)
0	(0,0;1,1;0,0;0,0;1,1;0,0;0,0;0,0;1,1;0,0;1,1;1,1;1,1;1,1;1,1;1,1;0,0;0,0;1,1;0,0;1,1;1,1;1,1;1,1;0,0;0,0;1,1;1,1;0,0;0,0;1,1;1,1;1,1;0,0)
1	(1,1;1,1;1,1;0,0;0,0;1,1;1,1;0,0;0,0;0,0;1,1;1,1;1,1;1,1;1,1;0,0;1,1;0,0;1,1;1,1;0,0;1,1;0,0;0,0;1,1;0,0;0,0;1,1;0,0;0,0)
2	(1,1;0,0;0,0;1,1;1,1;1,1;0,0;1,1;1,1;1,1;0,0;0,0;1,1;0,0;1,1;0,0;1,1;1,1;0,0;1,1;1,1;1,1;1,1;0,0;0,0;1,1;0,0;0,0;0,0)
3	(0,0;0,0;0,0;0,0;1,1;1,1;1,1;0,0;0,0;0,0;0,0;0,0;0,0;0,0;1,1;0,0;0,0;1,1;1,1;1,1;0,0;1,1;0,0;1,1;1,1;0,0;1,1;0,0;0,0;0,0)
4	(1,1;0,0;1,1;0,0;0,0;1,1;1,1;1,1;0,0;0,0;0,0;1,1;1,1;0,0;1,1;1,1;0,0;0,0;1,1;0,0;1,1;1,1;1,1;1,1;1,1;0,0;1,1;0,0;0,0)
5	(0,0;0,0;1,1;0,0;1,1;0,0;0,0;1,1;1,1;0,0;1,1;0,0;1,1;1,1;1,1;0,0;0,0;1,1;0,0;0,0;0,0;0,0;0,0;1,1;1,1;1,1;0,0;0,0;0,0)
6	(1,1;0,0;1,1;1,1;1,1;1,1;1,1;1,1;0,0;1,1;1,1;0,0;1,1;1,1;0,0;1,1;0,0;0,0;1,1;1,1;1,1;0,0;1,1;1,1;0,0;1,1;0,0;0,0;0,0)
7	(1,1;0,0;1,1;1,1;1,1;1,1;1,1;0,0;1,1;1,1;0,0;1,1;0,0;1,1;1,1;1,1;0,0;0,0;0,0;0,0;1,1;1,1;0,0;1,1;1,1;1,1;0,0;0,0;0,0)

**Higher symbol rate burst for 16QAM**

Bit Number (BN)	Length of field (bits)	Contents of field	Definition
0 – 15	16	tail bits	(below)
16 – 291	276	encrypted bits (e0 . e275)	45.003
292 – 415	124	training sequence bits	(below)
416 – 691	276	encrypted bits (e276 . e551)	45.003
692 – 707	16	tail bits	(below)
708 - 749	42	guard period	Subclause 5.2.8

- where the "tail bits" are defined as modulating bits with states as follows (bits are grouped in symbols separated by ;):

(BN0, BN1 .. BN15) = ([tbd]) and

(BN692, BN693 .. BN707) = ([tbd])

- where the "training sequence bits" are defined as modulating bits with states as given in the following table according to the training sequence code, TSC. For BCCH and CCCH, the TSC must be equal to the BCC, as defined in 3GPP TS 23.003. In networks supporting E-OTD Location services (see 3GPP TS 43.059), the use of 16QAM modulation on BCCH frequencies might degrade E-OTD Location service performance.

## 5.2.7 Access burst (AB)

Bit Number (BN)	Length of field	Contents of field	Definition
0 - 7	8	extended tail bits	(below)
8 - 48	41	synch. sequence bits	(below)
49 - 84	36	encrypted bits (e0..e35)	45.003
85 - 87	3	tail bits	(below)
(88 - 156)	68,25	extended guard period (bits)	subclause 5.2.8)

- where the "extended tail bits" are defined as modulating bits with the following states:

(BN0, BN1, BN2 .. BN7) = (0, 0, 1, 1, 1, 0, 1, 0)

- where the "tail bits" are defined as modulating bits with the following states:

(BN85, BN86, BN87) = (0, 0, 0)

- where the "synch. sequence bits" are defined as modulating bits with the following states, unless explicitly stated otherwise (see 3GPP TS 44.060):

(BN8, BN9 .. BN48) = (0, 1, 0, 0, 1, 0, 1, 1, 0, 1, 1, 1, 1, 1, 1, 1, 1, 0, 0, 1, 1, 0, 0,  
1, 1, 0, 1, 0, 1, 0, 1, 0, 0, 0, 1, 1, 1, 1, 0, 0, 0)

in case alternative training (synchronization) sequence "TS1" is used, the "synch. sequence bits" shall be defined as modulating bits with the following states:

(BN8, BN9 .. BN48) = (0, 1, 0, 1, 0, 1, 0, 0, 1, 1, 1, 1, 1, 0, 0, 0, 1, 0, 0, 0, 0, 1, 1,  
0, 0, 0, 1, 0, 1, 1, 1, 1, 0, 0, 1, 0, 0, 1, 1, 0, 1)

in case alternative training (synchronization) sequence "TS2" is used, the "synch. sequence bits" shall be defined as modulating bits with the following states:

(BN8, BN9 .. BN48) = (1, 1, 1, 0, 1, 1, 1, 1, 0, 0, 1, 0, 0, 1, 1, 1, 0, 1, 0, 1, 0, 1, 1,  
0, 0, 0, 0, 0, 1, 1, 0, 1, 1, 0, 1, 1, 1, 0, 1, 1, 1)

## 5.2.8 Guard period

The guard period is provided because it is required for the MSs that transmission be attenuated for the period between bursts with the necessary ramp up and down occurring during the guard periods as defined in 3GPP TS 45.005. A base transceiver station is not required to have a capability to ramp down and up between adjacent bursts, but is required to have a capability to ramp down and up for non-used time-slots, as defined in 3GPP TS 45.005. In any case where the amplitude of transmission is ramped up and down, then by applying an appropriate modulation bit stream interference to other RF channels can be minimized.

## 5.3 Physical channels and bursts

The description of a physical channel will be made in terms of timeslots and TDMA frames and not in terms of bursts. This is because there is not a one to one mapping between a particular physical channel, and the use of a particular burst.

## 5.4 Radio frequency channel sequence

The radio frequency channel sequence is determined by a function that, in a given cell, with a given set of general parameters, (see subclause 5.6.2), with a given timeslot number (TN), a given mobile radio frequency channel allocation (MA) and a given mobile allocation index offset (MAIO), maps the TDMA frame number (FN) to a radio frequency channel.

In a given cell there is therefore, for a physical channel assigned to a particular mobile, a unique correspondence between radio frequency channel and TDMA frame number.

The detailed hopping generation algorithm is given in subclause 6.2.

## 5.5 Timeslot and TDMA frame sequence

A given physical channel shall always use the same timeslot number in every TDMA frame. Therefore a timeslot sequence is defined by:

- i) a timeslot number (TN); and
- ii) a TDMA frame number sequence.

The detailed definitions of TDMA frame number sequences are given in clause 7.

The physical channels where the TDMA frame number sequence is 0,1, . FN\_MAX (where FN\_MAX is defined in subclause 4.3.3) are called "basic physical channels".

## 5.6 Parameters for channel definition and assignment

### 5.6.1 General

This subclause describes the set of parameters necessary to describe fully the mapping of any logical channel onto a physical channel. These parameters may be divided into general parameters, that are characteristic of a particular base transceiver station, and specific parameters, that are characteristic of a given physical channel.

### 5.6.2 General parameters

These are:

- i) the set of radio frequency channels used in the cell (CA), together with the identification of the BCCH carrier.
- ii) the TDMA frame number (FN), which can be derived from the reduced TDMA frame number (RFN) which is in the form T1, T2, T3', see 3.3.2.

These parameters are broadcast (or derived from parameters broadcast) in the BCCH and SCH.

For COMPACT, these are:

- i) the set of radio frequency channels used in the cell (CA), together with the identification of the COMPACT CPBCCCH carrier (primary COMPACT carrier).
- ii) the TDMA frame number (FN), which can be derived from the reduced TDMA frame number (RFN) which is in the form R1 and R2, see 3.3.2.
- iii) the time group number (TG)

These parameters are broadcast (or derived from parameters broadcast) in the COMPACT CPBCCCH and CSCH.

### 5.6.3 Specific parameters

These parameters define a particular physical channel in a base transceiver station. They are:

- o) the training sequence Code (TSC);
- i) the timeslot number (TN);
- ii) the mobile radio frequency channel allocation (MA);
- iii) the mobile allocation index offset (MAIO);

- iv) the hopping sequence number (HSN);
- v) the type of logical channel;
- vi) the sub-channel number (SCN).

The last two parameters allow the determination of the frame sequence.

---

## 6 Mapping of logical channels onto physical channels

### 6.1 General

The detailed mapping of logical channels onto physical channels is defined in the following sections. Subclause 6.2 defines the mapping from TDMA frame number (FN) to radio frequency channel (RFCH). Subclause 6.3 defines the mapping of the physical channel onto TDMA frame number. Subclause 6.4 lists the permitted channel combinations and subclause 6.5 defines the operation of channels and channel combinations.

### 6.2 Mapping in frequency of logical channels onto physical channels

#### 6.2.1 General

The parameters used in the function which maps TDMA frame number onto radio frequency channel are defined in subclause 6.2.2. The definition of the actual mapping function, or as it is termed, hopping sequence generation is given in subclause 6.2.3.

In CTS, the specific mapping in frequency depends on the start condition defined by the parameters given in subclause 6.2.2. The hopping sequence generation for CTS is given in subclause 6.2.3.

#### 6.2.2 Parameters

The following parameters are required in the mapping from TDMA frame number to radio frequency channel for a given assigned channel.

General parameters of the BTS, specific to one BTS, and broadcast in the BCCH and SCH:

- i) CA: Cell allocation of radio frequency channels.
- ii) FN: TDMA frame number, broadcast in the SCH, in form T1, T2, T3' (see subclause 3.3.2). For COMPACT, FN is broadcast in the CSCH, in form R1, R2 (see subclause 3.2.2).

Specific parameters of the channel, defined in the channel assignment message:

- i) MA: Mobile allocation of radio frequency channels, defines the set of radio frequency channels to be used in the mobiles hopping sequence. The MA contains N radio frequency channels, where  $1 \leq N \leq 64$ .

For COMPACT, the reduced MA (see 3GPP TS 44.060) shall be used for a fixed amount of data blocks, see section 6.2.4.

- ii) MAIO: Mobile allocation index offset.(0 to N-1, 6 bits).

For COMPACT, MAIO\_2 shall be used for the data blocks using the reduced MA.

- iii) HSN: Hopping sequence (generator) number (0 to 63, 6 bits).

In CTS, the following parameters are required in the mapping to radio frequency channel for a CTS-FP and CTS-MS pair. They are given by the CTS-FP to the CTS-MS during the non-hopping access procedure :

- i) VA: the vector  $\underline{a}$  defines the elements which are used from the shift register to generate the codeword. The vector  $\underline{a}$  shall be randomly chosen upon up to 16 non-repeating integer elements where  $0 \leq a_i < 16$  and  $a_i \neq a_j$  for  $i \neq j$ .
- ii) VV: the elements of vector  $\underline{v}$  are added modulo 2 to the codeword from the shift register. For vector  $\underline{v}$ , up to 16 binary elements shall be chosen randomly.

NOTE: The length of the vectors  $\underline{a}$  and  $\underline{v}$  is dependent on the number of frequencies used for the hopping and can be truncated according to the number of frequencies used (see vi) below).

- iii) CSR: current shift register contents. In order that a CTS-MS is able to synchronize on a running hopping sequence the CTS-FP transmits the CSR.

iv) TFHC1: value of counter TFHC1.

v) TFHC2: value of counter TFHC2.

- vi) TFH carrier list (see 3GPP TS 45.056): ordered list of frequencies, with 1<sup>st</sup> freq referenced by the frequency index 1, 2<sup>nd</sup> frequency referenced by the frequency index 2, etc.

The number of frequencies in the TFH carrier list, NF shall be computed. The number of elements to be taken from the vectors  $\underline{a}$  and  $\underline{v}$  shall be determined by the function  $\lceil \log_2 \text{NF} \rceil$

- vii) VC: the vector  $\underline{c}$  is the base sequence to map the codeword. It shall be randomly chosen upon NF non-repeating integer elements:

$$c = \{c_0, c_1, \dots, c_{\text{NF}-1}\}, 0 \leq c_i < \text{NF} \text{ and } c_i \neq c_j \text{ for } i \neq j.$$

### 6.2.3 Hopping sequence generation

For a given set of parameters, the index to an absolute radio frequency channel number (ARFCN) within the mobile allocation (MAI from 0 to N-1, where MAI=0 represents the lowest ARFCN in the mobile allocation, ARFCN is in the range 0 to 1023 and the frequency value can be determined according to 3GPP TS 45.005), is obtained with the following algorithm:

**if** HSN = 0 (cyclic hopping) **then**:

$$\text{MAI, integer (0 .. N-1)} : \text{MAI} = (\text{FN} + \text{MAIO}) \text{ modulo } \text{N}$$

**else**:

$$\text{M, integer (0 .. 152)} : \text{M} = \text{T2} + \text{RNTABLE}((\text{HSN} \text{ xor } \text{T1R}) + \text{T3})$$

$$\text{S, integer (0 .. N-1)} : \text{M}' = \text{M} \text{ modulo } (2 \wedge \text{NBIN})$$

$$\text{T}' = \text{T3} \text{ modulo } (2 \wedge \text{NBIN})$$

**if** M' < N **then**:

$$\text{S} = \text{M}'$$

**else**:

$$\text{S} = (\text{M}' + \text{T}') \text{ modulo } \text{N}$$

$$\text{MAI, integer (0 .. N-1)} : \text{MAI} = (\text{S} + \text{MAIO}) \text{ modulo } \text{N}$$

NOTE: Due to the procedure used by the mobile for measurement reporting when DTX is used, the use of cyclic hopping where  $(\text{N}) \bmod 13 = 0$  should be avoided.

where:

T1R: time parameter T1, reduced modulo 64 (6 bits)

T3: time parameter, from 0 to 50 (6 bits)

T2: time parameter, from 0 to 25 (5 bits)

NBIN: number of bits required to represent  $N = \text{INTEGER}(\log_2(N)+1)$

$\wedge$ : raised to the power of

xor: bit-wise exclusive or of 8 bit binary operands

RNTABLE: Table of 114 integer numbers, defined below:

Address	Contents									
000...009:	48,	98,	63,	1,	36,	95,	78,	102,	94,	73,
010...019:	0,	64,	25,	81,	76,	59,	124,	23,	104,	100,
020...029:	101,	47,	118,	85,	18,	56,	96,	86,	54,	2,
030...039:	80,	34,	127,	13,	6,	89,	57,	103,	12,	74,
040...049:	55,	111,	75,	38,	109,	71,	112,	29,	11,	88,
050...059:	87,	19,	3,	68,	110,	26,	33,	31,	8,	45,
060...069:	82,	58,	40,	107,	32,	5,	106,	92,	62,	67,
070...079:	77,	108,	122,	37,	60,	66,	121,	42,	51,	126,
080...089:	117,	114,	4,	90,	43,	52,	53,	113,	120,	72,
090...099:	16,	49,	7,	79,	119,	61,	22,	84,	9,	97,

110...113:	125,	99,	17,	123,						

The hopping sequence generation algorithm is represented diagrammatically in figure 6.

This algorithm applies also to COMPACT, whereby the parameters T1, T2 and T3 shall be calculated from FN.

In CTS, the general structure of the hopping sequence generation algorithm is shown in figure 6a, with the example of vector  $\underline{a} = (a_0, a_1, a_2, a_3) = (5, 8, 2, 11)$  and  $NF = 9$ . It consists of a 16 bit linear feedback shift register and two counters. The shift register in the CTS-FP shall be initialized with a random number which shall not be zero. The counter TFHC1 counts modulo NF the number of TDMA frames. The overflow of this counter causes a shift in the shift register. The counter TFHC2 counts modulo NF the number of shifts.

The elements which are used from the shift register to generate the codeword are defined by the vector  $\underline{a}$ . The codeword is built using a modulo 2 addition of these elements and the elements of vector  $\underline{v}$ . Before mapping the codeword into a sequence, the value of the counter TFHC2 is added modulo NF. The mapping is done by a modulo NF addition to the base sequence  $\underline{c}$ . This results in a sequence containing NF elements, each element representing one frequency index in the TFH list. The value of counter TFHC1 points to the current frequency index to use.

## 6.2.4 Specific cases

On the RFCH carrying a BCCH (C0), frequency hopping is not permitted on any timeslot supporting a BCCH according to table 3 of clause 7. A non-hopping radio frequency channel sequence is characterized by a mobile allocation consisting of only one radio frequency channel, i.e. with  $N=1$ ,  $MAIO=0$ . In this instance sequence generation is unaffected by the value of the value HSN.

For COMPACT, frequency hopping is not permitted on CPBCCH or CPCCCH for a specific amount of  $N\_CCCH\_NH$  blocks according to the ordered list described in subclause 6.3.2.1. If CPCCCH is defined as frequency hopping, those blocks use  $MAI = MAIO$ .

For COMPACT, on other frequency hopping channels, the reduced MA and MAIO\_2 shall be used for a specific amount of  $N\_CCCH\_NH$  blocks according to the ordered list described in subclause 6.3.2.1.

For COMPACT, in case the optional information elements reduced MA and MAIO\_2 are not present in the assignment message and the MA and MAIO information elements are present in the assignment message, then the MS shall hop in all allocated time slots according to the MA and MAIO.

## 6.2.5 Change in the frequency allocation of a base transceiver station

The consequence of adding or removing a number of radio frequency channels in a base transceiver station is a modification of the cell allocation (CA) and the mobile allocation (MA). In order to achieve this without disruption to mobile stations with currently assigned channels it is necessary to send a message to all mobiles with assigned channels.

The message, as defined in 3GPP TS 44.018, will contain a new cell allocation (if necessary), mobile allocation and a time (in the form of a TDMA frame number) at which the change is to occur. A new cell allocation may not be necessary if channels are only being removed, and not added.

## 6.2.6 Frequency assignment in CTS

The CTSBCH (CTSBCH-FB and CTSBCH-SB) shall always be mapped on the CTSBCH RF channel (designated as C0 in table 8 of clause 7).

The CTSPCH, CTSARCH and CTSAGCH shall be mapped on the predefined set of carriers called TFH carrier list (designated by C0... Cn in Clause 7 Table 8) by the CTS frequency hopping algorithm specified in subclauses 6.2.2 and 6.2.3. However, the CTSARCH and CTSAGCH shall be mapped on the CTSBCH RF channel for the specific case of the non-hopping access procedure specified in 3GPP TS 44.056; the block TDMA frame mapping for these exceptions is specified in clause 7 table 8. The methods for the determination of the CTSBCH RF channel and the TFH carrier list are defined in 3GPP TS 45.056.

The TCH, FACCH and SACCH used for a CTS dedicated connection shall always be mapped on the TFH carrier list (C0..Cn) by the CTS frequency hopping algorithm. However, one exception is specified in the case of the CTS enrolment and attachment of a CTS-MS (see 3GPP TS 44.056), where a non-hopping access procedure is used; in these particular cases, the dedicated connection shall be used in non-hopping mode and the TCH, FACCH and SACCH shall be mapped on the CTSBCH RF channel (C0).

## 6.3 Mapping in time of logical channels onto physical channels

### 6.3.1 Mapping in time of circuit switched logical channels onto physical channels

#### 6.3.1.1 General

The mapping in time of circuit switched logical channels is defined in the tables of clause 7, which also defines the relationship of the air interface frames to the multiframe.

#### 6.3.1.2 Key to the mapping table of clause 7

The following relates to the tables of clause 7. The columns headed:

- i) "Channel designation" gives the precise acronym for the channel to which the mapping applies.
- ii) "Sub-channel number" identifies the particular sub-channel being defined where a basic physical channel supports more than one channel of this type.
- iii) "Direction" defines whether the mapping given applies identically to downlink and uplink (D&U), or to downlink (D) or uplink (U) only.
- iv) "Allowable timeslots assignments" defines whether the channel can be supported on, or assigned to, any of the timeslots, or only on specific timeslots.
- v) "Allowable RF channel assignments" defines whether the channel can use any or all of the radio frequency channels in the cell allocation (CA), or only the BCCH carrier (C0). It should be noted that any allocated channel Cx within CA could be any radio frequency channel, and that no ordering of radio frequency channel number is implied. For example, allocated channel C0 need not have the lowest radio frequency channel number of the allocation.
- vi) "Burst type" defines which type of burst as defined in clause 5.2 is to be used for the physical channel.
- vii) "Repeat length in TDMA frames" defines how many TDMA frames occur before the mapping for the interleaved blocks repeats itself e.g. 51.

- viii) "Interleaved block TDMA frame mapping" defines, within the parentheses, the TDMA frames used by each interleaved block (e.g. 0..3). The numbers given equate to the TDMA frame number (FN) modulo the number of TDMA frames per repeat length; Therefore, the frame is utilized when:

TDMA frame mapping number = (FN)mod repeat length given

Where there is more than one block shown, each block is given a separate designation e.g. B0, B1. Where diagonal interleaving is employed then all of the TDMA frames included in the block are given, and hence the same TDMA frame number can appear more than once (see 3GPP TS 45.003). Also, for E-TCH/F28.8, E-TCH/F32.0 and E-TCH/F43.2, the same frame number appears for the inband signalling message and for several interleaved blocks. It should be noted that the frame mapping for the SACCH/T channel differs according to the timeslot assigned in order to lower the peak processing requirements of the BSS.

### 6.3.1.3 Mapping of BCCH data

In order to facilitate the MS operation, it is necessary to transmit some System Information messages in defined multiframes and defined blocks within one multiframe, as follows (where  $TC = (FN \text{ DIV } 51) \text{ mod } (8)$ ). Also for some System Information messages, the position where they are transmitted is contained in other System Information messages:

System Information Message	Sent when TC =	Allocation
Type 1	0	BCCH Norm
Type 2	1	BCCH Norm
Type 2 bis	5	BCCH Norm
Type 2 ter	5 or 4	BCCH Norm
Type 2 quater	5 or 4	BCCH Norm
	or	
	5	BCCH Ext
Type 2n	4	BCCH Norm
	or	
	4	BCCH Ext
Type 3	2 and 6	BCCH Norm
Type 4	3 and 7	BCCH Norm
Type 7	7	BCCH Ext
Type 8	3	BCCH Ext
Type 9	4	BCCH Norm
Type 13	4	BCCH norm
	or	
	0	BCCH Ext
Type 13 alt	4	BCCH norm
	or	
	0	BCCH Ext
Type 15	4	BCCH Norm
	or	
	1	BCCH Ext
Type 16	6	BCCH Ext
Type 17	2	BCCH Ext
Type 18	Not fixed	Not fixed
Type 19	Not Fixed	Not Fixed
Type 20	Not fixed	Not fixed

This subclause defines requirements on minimum scheduling: the network may send any System Information message when sending of a specific System Information message is not required. The following rules apply:

- i) BCCH Ext may share the resource with PCH and AGCH (see subclause 6.5.1).
- ii) System Information Type 1 needs to be sent if frequency hopping is in use or when the NCH is present in a cell. If the MS finds another message when  $TC = 0$ , it can assume that System Information Type 1 is not in use.
- iii) System information type 2 bis or 2 ter messages are sent if needed, as determined by the system operator. If only one of them is needed, it is sent when  $TC = 5$ . If both are needed, 2bis is sent when  $TC = 5$  and 2ter is sent at least once within any of 4 consecutive occurrences of  $TC = 4$ . A SI 2 message will be sent at least every time  $TC = 1$ . System information type 2 quater is sent if needed, as determined by the system operator. If sent on BCCH Norm, it shall be sent when  $TC = 5$  if neither of 2bis and 2ter are used, otherwise it shall be sent at least

once within any of 4 consecutive occurrences of  $TC = 4$ . If sent on BCCH Ext, it is sent at least once within any of 4 consecutive occurrences of  $TC = 5$ .

- iv) The definitions of BCCH Norm and BCCH Ext are given in table 3 of clause 7.
- v) Use of System Information type 7 and 8 is not always necessary. It is necessary if System Information type 4 does not contain all information needed for cell selection and reselection.
- vi) System Information type 9 is sent in those blocks with  $TC = 4$  which are specified in system information type 3 as defined in 3GPP TS 44.018.
- vii) System Information type 13 is only related to the GPRS service. System Information Type 13 need only be sent if GPRS support is indicated in one or more of System Information Type 3 or 4 or 7 or 8 messages. These messages also indicate if the message is sent on the BCCH Norm or if the message is transmitted on the BCCH Ext. In the case that the message is sent on the BCCH Norm, it is sent at least once within any of 4 consecutive occurrences of  $TC=4$ .
- viii) System Information type 16 and 17 are only related to the SoLSA service.
- ix) System Information type 18 and 20 are sent in order to transmit non-GSM broadcast information. The frequency with which they are sent is determined by the system operator. System Information type 9 identifies the scheduling of System Information type 18 and 20 messages.
- x) System Information Type 19 is sent if COMPACT neighbours exist. If System Information Type 19 is present, then its scheduling shall be indicated in System Information Type 9.
- xi) System Information Type 15 is broadcast if dynamic ARFCN mapping is used in the PLMN. If sent on BCCH Norm, it is sent at least once within any of 4 consecutive occurrences of  $TC = 4$ . If sent on BCCH Ext, it is sent at least once within any of 4 consecutive occurrences of  $TC = 1$ .
- xii) System Information type 13 alt is only related to the GERAN *Iu mode*. System Information Type 13 alt need only be sent if GERAN *Iu mode* support is indicated in one or more of System Information Type 3 or 4 or 7 or 8 messages and SI 13 is not broadcast. These messages also indicate if the message is sent on the BCCH Norm or if the message is transmitted on the BCCH Ext. In the case that the message is sent on the BCCH Norm, it is sent at least once within any of 4 consecutive occurrences of  $TC = 4$ .
- xiii) System Information Type 2n is optionally sent on BCCH or BCCH Ext if needed, as determined by the system operator. In the case that the message is sent on the BCCH Norm, it is sent at least once within any of 4 consecutive occurrences of  $TC = 4$ . If the message is sent on BCCH Ext, it is sent at least once within any of 2 consecutive occurrences of  $TC = 4$ .

All the allowable timeslot assignments in a frame (see table 3 of clause 7) shall contain the same information.

#### 6.3.1.4 Mapping of SID Frames

When the DTX mode of operation is active, it is required to transmit Silence Descriptor (SID) information, or equivalent dummy information, during the SACCH/T block period (104 TDMA frames). As the SID frames do not constitute a logical channel and their use is specific to DTX operation, the mapping of SID frames onto the TDMA frames is specified in 3GPP TS 45.008.

### 6.3.2 Mapping in time of packet logical channels onto physical channels

#### 6.3.2.1 General

A physical channel allocated to carry packet logical channels is called a packet data channel (PDCH). A PDCH shall carry packet logical channels only.

In the case of RTTI configurations, physical channels are paired, forming PDCH-pairs. The two physical channels shall have the same parameters (see subclause 5.6.3) except for the timeslot number (TN). The two PDCHs constituting a PDCH-pair shall be located on the same carrier. The two PDCHs constituting a PDCH-pair need not be contiguous. In each direction, physical channels shall be assigned so that PDCH-pairs do not partially overlap.

On a given PDCH, PDTCHs in both BTTI configuration and RTTI configuration (assigned to different mobile stations) may be carried. Alternatively, both PDCHs forming a PDCH-pair may be assigned to only carry PDTCHs in RTTI configuration.

Packet switched logical channels are mapped dynamically onto a 52-multiframe.

- For a PDCH/F used within a BTTI configuration the 52-multiframe consists of 12 blocks of 4 consecutive frames, 2 idle frames and 2 frames used for the PTCCH (see 3GPP TS 45.010), as shown in Figure 9. Table 6 in clause 7, indicates the frame numbers for each of the blocks (B0...B11) transmitted in the multiframe. The ordered list of block is defined as B0, B6, B3, B9, B1, B7, B4, B10, B2, B8, B5, B11.
- For PDCH/H, the 52-multiframe consists of 6 blocks of 4 frames each, and two idle frames. Table 6 in clause 7 indicates the frame numbers for each of the blocks (B0...B5) transmitted in the multiframe.
- For a PDCH-pair used within an RTTI configuration the 52-multiframe consists of 24 RTTI blocks of 2 consecutive frames, plus 2 idle frames and 2 frames used for the PTCCH (see 3GPP TS 45.010) on each PDCH of the PDCH-pair, as shown in Figure 9a. Table 6 in clause 7 indicates the frame numbers for each of the 24 RTTI blocks (B0<sub>a</sub>, B0<sub>b</sub>, ...B11<sub>a</sub>, B11<sub>b</sub>) transmitted in the 52-multiframe.

A block allocated to a given logical channel comprises one radio block, or in the case of uplink only, 4 random access bursts. The type of channel may vary on a block-by-block basis.

In the downlink direction, the logical channel type shall be indicated by the message type contained in the block header part.

In the uplink part for channels other than PACCH transmitted as access bursts or PRACH or CPRACH, the logical channel type shall be indicated by the message type contained in the block header part. For PACCH transmitted as access bursts, the logical channel type is indicated by the corresponding polling message on the downlink (see 3GPP TS 44.060). For the PRACH or CPRACH case the logical channel type is indicated by the USF (see 3GPP TS 44.060), set on the downlink on a block by block basis.

For COMPACT, timeslot mapping and rotation of the control channels is used such that control channels belonging to a serving time group are rotated over odd timeslot numbers as follows: 7, 5, 3, 1, 7, 5 ... . The rotation occurs between frame numbers (FN) mod 52 = 3 and 4. The mapping of the control channels on timeslot numbers is defined by the following formula:

- for  $0 \leq \text{FN mod } 52 \leq 3$ ,  $\text{TN} = ((6 \times ((\text{FN div } 52) \text{ mod } 4)) + 1 + (2 \times \text{TG})) \text{ mod } 8$ ;
- for  $4 \leq \text{FN mod } 52 \leq 51$ ,  $\text{TN} = ((6 \times ((\text{FN div } 52) \text{ mod } 4)) + 7 + (2 \times \text{TG})) \text{ mod } 8$ .

Packet switched logical channels PDTCH, PACCH, and PTCCH are never rotated.

## 6.3.2.2 Mapping of the uplink channels

### 6.3.2.2.1 Mapping of uplink packet traffic channel (PDTCH/U) and PACCH/U

#### 6.3.2.2.1.1 Basic TTI configurations

The PDCH's where the MS may expect occurrence of its PDTCH/U(s) or PACCH/U for a mobile originated transfer is indicated in resource assignment messages (see 3GPP TS 44.060). PACCH/U shall be allocated respecting the resources assigned to the MS and the MS multislot class. For each PDCH assigned to the MS, an Uplink State Flag (R0... R7) is given to the MS.

The occurrence of the PDTCH/U and/or the PACCH/U at given block(s) B<sub>x</sub> (where B<sub>x</sub> = B0...B<sub>n</sub>; n=5 for the PDTCH/HU and n=11 for the PDTCH/FU) in the 52-multiframe structure for a given MS on a given PDCH shall be indicated by the value of the Uplink State Flag (USF) contained in the header of the preceding block transmitted in the downlink of the same PDCH (or in the case of shifted USF on the downlink of a PDCH with a relationship to the uplink PDCH as defined in 3GPP TS 44.060), that is to say B<sub>(x-1)</sub> in the same multiframe if x≥1 or B<sub>(n)</sub> in the previous multiframe if x=0. If the USF in block B<sub>(x-1)</sub> indicates that block B<sub>(x)</sub> shall be used by an MS for which the USF\_GRANULARITY is set to 1 (corresponding to 4 blocks) in the last assignment message, that MS shall also use the three following blocks. The USF corresponding to the last three blocks shall be set to an unused value. The MS may transmit a PDTCH block or a PACCH block on any of the uplink blocks used by the MS. The occurrence of the PACCH/U associated to a PDTCH/D shall be indicated by the network by polling the MS (see 3GPP TS 44.060).

NOTE: This subclause specifies how the network shall signal that the MS is allowed to use the uplink. The operation of the MS is specified in 3GPP TS 44.060. In particular cases of extended dynamic allocation or exclusive allocation, the MS may not need to monitor the USF on all the downlink timeslots corresponding to the assigned uplink PDCHs.

NOTE: The PDCH/HU is only assigned in exclusive allocation (see 3GPP TS 44.060).

NOTE: A MS using packet uplink traffic channels mapped to the same physical channel than an uplink PCCCH in extended dynamic allocation MAC mode is not required to check if allocated uplink PDTCH/U or PACCH/U blocks also belong to the PRACH.

In a dual carrier configuration, the uplink block(s) shall be allocated on the corresponding physical channel on which the USF or poll (see 3GPP TS 44.060) is received. Uplink blocks shall not be allocated on physical channels having different frequency domain descriptions (see subclause 5.4) simultaneously in the same block period.

For COMPACT, USF\_GRANULARITY should be set to 0 (corresponding to 1 block) for dynamic allocation for the following cases:

- i) for odd timeslot numbers (TN) 1, 3, 5, and 7 in nominal and large cells;
- ii) for even timeslot numbers (TN) 0, 2, 4, and 6 in large cells.

#### 6.3.2.2.1.2 Reduced TTI configurations

The PDCH-pairs where the MS may expect occurrence of its PDTCH/U(s) or PACCH/U for a mobile originated transfer are indicated in resource assignment messages (see 3GPP TS 44.060). PACCH/U shall be allocated respecting the resources assigned to the MS and the MS multislot class.

For each PDCH-pair assigned to the MS, one or two Uplink State Flags (R0... R7) are given to the MS. For each assigned uplink PDCH-pair the network may signal in resource assignment messages a 'corresponding downlink PDCH-pair' where the USF is monitored. The timeslot numbers of the PDCHs constituting the corresponding downlink PDCH-pair may be different from those of the PDCHs constituting the uplink PDCH-pair. If no indication is provided, the corresponding downlink PDCH-pair shall be the one with the same timeslot numbers as the uplink PDCH-pair.

For an assigned uplink PDCH-pair, for the transmission of the USF the network can use one of two modes:

- BTTI USF mode: USFs are sent in a basic radio block period, i.e. a USF is mapped on four bursts transmitted on one of the PDCHs of a downlink PDCH-pair during four consecutive TDMA frames;
- RTTI USF mode: a USF is sent in one reduced radio block period, i.e. a USF is mapped on four bursts transmitted on both PDCHs of a downlink PDCH-pair during two consecutive TDMA frames.

The network shall signal the USF mode in the resource assignment messages (see 3GPP TS 44.060). The USF mode shall be the same for all the uplink PDCH-pairs assigned to one mobile station. Also, on a given downlink PDCH-pair, all USFs shall be sent with the same USF mode.

If the BTTI USF mode is used, for each PDCH-pair assigned to the MS the network shall give two Uplink State Flags (R0... R7) to the MS, one for each PDCH of the corresponding downlink PDCH-pair. If the RTTI USF mode is used, for each PDCH-pair assigned the network shall give to the MS one Uplink State Flag (R0... R7) to the MS.

When a given downlink PDCH is configured to provide USFs for PDTCHs operating in RTTI configuration (as part of a corresponding downlink PDCH-pair) and PDTCHs operating in BTTI configuration, the BTTI USF mode shall be used on both PDCHs of the corresponding downlink PDCH-pair to schedule uplink blocks for mobile stations using RTTI configuration. Additionally, if any of the downlink PDTCHs mapped onto either PDCH of a corresponding PDCH-pair operates in BTTI configuration, the BTTI USF mode shall be used on both PDCHs. In this case, if  $x \geq 1$ , the first uplink RTTI radio block  $B_{x_a}$  shall be allocated by the USF contained in block  $B(x-1)$  of the downlink PDCH having the lowest TN and the second uplink RTTI radio block  $B_{x_b}$  shall be allocated by the USF contained in block  $B(x-1)$  of the highest numbered PDCH TN of the 'corresponding downlink PDCH-pair' to the uplink PDCH-pair (see Figure 9a and 3GPP TS 44.060). If  $x=0$  the corresponding USFs will be carried within block B11 of the previous 52-multiframe. In case of dual carrier configuration in the downlink, this same relationship between USFs and uplink RTTI radio blocks shall apply. If the USF\_GRANULARITY is set to 1 (corresponding to 4 blocks) in the last assignment message, the MS shall also use the next three consecutive RTTI radio blocks of sub-index a or sub-index b (according to the PDCH in which the USF was received), see 3GPP TS 44.060. The USF corresponding to the last three blocks shall be set to an unused value.

When on a downlink PDCH belonging to a PDCH-pair a USF is sent scheduling an uplink block belonging to a mobile station using a BTTI configuration, the USF on the other PDCH of the 'corresponding PDCH-pair' shall also schedule an uplink block belonging to a mobile station using a BTTI configuration.

When both PDCHs of a corresponding downlink PDCH-pair are configured to provide USFs for uplink PDTCHs all operating in RTTI configuration, and when all the downlink PDTCHs mapped onto both PDCHs operate in RTTI configuration, the RTTI USF mode shall be used on both PDCHs. In this case, if  $x \geq 1$ , the uplink RTTI radio block  $B_{x_a}$  shall be allocated by the USF contained in RTTI block  $B_{(x-1)_b}$  and uplink RTTI radio block  $B_{x_b}$  shall be allocated by the USF contained in RTTI block  $B_{x_a}$  of the 'corresponding downlink PDCH-pair' to the uplink PDCH-pair (see Figure 9a and 3GPP TS 44.060). If  $x=0$  the USFs will be carried within RTTI block  $B_{11_b}$  of the previous 52-multiframe and  $B_{0_a}$  respectively. If the USF\_GRANULARITY is set to 1 (corresponding to 4 blocks) in the last assignment message, the MS shall also use the next three consecutive RTTI radio blocks, see 3GPP TS 44.060. The USF corresponding to the last three blocks shall be set to an unused value.

The MS may transmit a PDTCH block or a PACCH block on any of the uplink blocks allocated to the MS. The occurrence of the PACCH/U associated to a PDTCH/D shall be indicated by the network by polling the MS (see 3GPP TS 44.060).

#### 6.3.2.2.2 Mapping of the Packet Timing Advance Control Channel (PTCCH/U)

The PDCH carrying the PTCCH/U of one MS is defined in the resource assignment message (see 3GPP TS 44.060). PTCCH/U shall be mapped to one of the time slots where PDTCH(s) are allocated to the MS. PTCCH/U shall be allocated respecting the resources assigned to the MS and the MS multislot class. An MS shall be allocated a sub-channel of the PTCCH/U (0...15) as defined in table 6 of clause 7, where the sub-channel number is equal to the Timing Advance Index (TAI) indicated in the resource allocation message (see 3GPP TS 44.060).

In a dual carrier configuration, an MS shall be assigned a PTCCH/U sub-channel on a physical channel having one frequency domain description (see subclause 5.4) only.

In an RTTI configuration, an MS shall be assigned a PTCCH/U on only one of the physical channels comprising an uplink PDCH-pair (see subclause 6.3.2.1).

#### 6.3.2.2.3 Mapping of the uplink PCCCH i.e. PRACH

The mapping of the PRACH is defined in table 6 of clause 7, where the possible blocks are indicated. The PRACH is dynamically allocated in groups of four PRACH blocks  $B_y$  ( $y=4x+i$ ,  $i=0, \dots, 3$ ) corresponding to one PDCH block  $B_x$  ( $x=0, \dots, 11$ ), indicated by USF=FREE in the same way as defined for PDTCH/U (see subclause 6.3.2.2.1).

Optionally, a subset of the blocks  $B_x$  can be allocated to PRACH in a fixed way. The number of allocated blocks is indicated by the parameter BS\_PRACH\_BLKs broadcast on the PBCCH, where BS\_PRACH\_BLKs=0...12. The blocks are allocated according to the ordered list defined in subclause 6.3.2.1. The blocks shall also be indicated by the USF=FREE. The MS may choose to use the BS\_PRACH\_BLKs or USF to determine the fixed allocated part of PRACH.

#### 6.3.2.2.3a Mapping of the COMPACT uplink CPCCCH i.e. CPRACH

The CPRACH is dynamically or fixed allocated in the same way as defined for PRACH (see subclause 6.3.2.2.3). USF should be set equal to FREE for downlink block  $B_0$  on a serving time group when 4 time groups are assigned. Uplink blocks (other than block  $B_1$  on a serving time group) that are preceded by CPBCCH and CPCCCH blocks should be prioritized for use as CPRACH.

See Annex D for examples based on sixteen prioritized CPRACH blocks.

#### 6.3.2.2.4 Mapping of the MBMS uplink MPRACH

The mapping of the MPRACH is defined in table 6 of clause 7, where the possible blocks are indicated. The MPRACH is dynamically allocated in groups of four MPRACH blocks  $B_y$  ( $y=4x+i$ ,  $i=0, \dots, 3$ ) corresponding to one PDCH block  $B_x$  ( $x=0, \dots, 11$ ), indicated by a value of the USF, in the same way as defined for PDTCH/U (see subclause 6.3.2.2.1). The value of the USF is signalled in the MBMS notification message (see 3GPP TS 44.060).

### 6.3.2.3 Mapping of the downlink channels

#### 6.3.2.3.1 Mapping of the (PDTCH/D) and PACCH/D

The PDCH(s) (for a BTTI configuration) or the PDCH-pair(s) (for an RTTI configuration) where the MS may expect occurrence of its PDTCH/D(s) for a mobile terminated transfer or its PACCH/D, for both mobile originated and mobile terminated transfer, are indicated in resource assignment messages (see 3GPP TS 44.060). PDTCH/D and PACCH/D can be mapped dynamically on all blocks except those used for PBCCH (see subclause 6.3.2.3.3). The logical channel type shall be indicated in the block header. The mobile owner of the PDTCH/D or PACCH/D shall be indicated by the TFI (Temporary Flow Identity) (see 3GPP TS 44.060).

If PDTCH/D is mapped on blocks, which may be used for PCCCH and where paging may appear, the network shall only use coding schemes CS-1 to CS-4.

**NOTE:** This restriction is needed to avoid the expiry of the downlink signalling counter (DSC) for non-EGPRS capable mobile stations in case the network uses MCS-1 to MCS-9. CS-1 should be favoured, as it provides the strongest error protection.

#### 6.3.2.3.2 Mapping of the PTCCH/D

The PTCCH/D is mapped as defined in table 6 of clause 7. The PTCCH/D carries signalling messages including timing advance information for MSs sharing the PTCCH/U on the same PDCH.

In a dual carrier configuration, an MS shall be assigned a PTCCH/D channel on a physical channel having one frequency domain description (see subclause 5.4) only.

In an RTTI configuration, an MS shall be assigned a PTCCH/D on only one of the physical channels comprising a downlink PDCH-pair (see subclause 6.3.2.1). When only an uplink PDTCH is assigned to the MS, the PTCCH shall be assigned on one of the PDCHs comprising the 'corresponding downlink PDCH-pair' for the uplink PDTCH (see subclause 6.3.2.2.1.2).

#### 6.3.2.3.3 Mapping of the PBCCH

The PBCCH is mapped onto one PDCH only, indicated in the BCCH. The PBCCH is mapped on BS\_PBCCH\_BLKs blocks (where  $1 \leq \text{BS\_PBCCH\_BLKS} \leq 4$ ) per multiframe, according to the ordered list described in subclause 6.3.2.1. The blocks allocated are specified in table 6 of clause 7. The parameter BS\_PBCCH\_BLKs is broadcast on PBCCH in block B0 (see subclause 3.3.2.4).

#### 6.3.2.3.3a Mapping of the COMPACT CPBCCH

The CPBCCH is mapped onto a primary COMPACT carrier on the time group indicated by TG on CSCH (see subclause 3.3.2.2). This time group is known as the serving time group and rotates over odd timeslot numbers (see subclause 6.3.2.1). The CPBCCH is mapped on BS\_PBCCH\_BLKs blocks (where  $1 \leq \text{BS\_PBCCH\_BLKS} \leq 4$ ) per multiframe, according to the ordered list described in subclause 6.3.2.1. The blocks allocated are specified in table 9 of clause 7. The parameters BS\_PBCCH\_BLKs is broadcast on CPBCCH in block B0 (see subclause 3.3.2.4).

See Annex D for examples based on one CPBCCH block.

When USF=FREE in downlink block B0 on a serving time group, the CPBACH is allocated in uplink block B1 after timeslot rotation. When USF has any other value in downlink block B0 on a serving time group, the uplink allocation of B1 is valid for the same timeslot, irrespective of timeslot rotation.

#### 6.3.2.3.4 Mapping of the PCCCH

The PCCCH and its different logical channels (PAGCH, PPCH) can be mapped dynamically and are identified by the message header. The configuration is partly fixed by some parameters broadcast by the PBCCH and defined in subclause 3.3.2.4:

- a) BS\_PBCCH\_BLKs, that defines the number of PBCCH blocks per multiframe, according to the ordered list described in subclause 6.3.2.1, on the PDCH that carries PBCCH;

- b) BS\_PAG\_BLKES\_RES, that defines the number of blocks in addition to BS\_PBCCH\_BLKES, according to the ordered list described in subclause 6.3.2.1, where PPCH shall not occur on every PDCH that carries PCCCH.

PCCCH (except PPCH) can be mapped on all blocks except those used for PBCCH.

If PBCCH is allocated on timeslot  $k$ , PCCCHs shall be allocated only on timeslots  $n$  where  $n > k - 4$  and  $0 \leq n \leq 7$  in order to provide time for the MS to switch from PBCCH to PCCCH.

#### 6.3.2.3.4a Mapping of the COMPACT CPCCCH

The CPCCCH and its different logical channels (CPAGCH, CPPCH) can be mapped dynamically and are identified by the message header. The configuration is partly fixed by some parameters broadcast by the CPBCCH and defined in subclause 3.3.2.4:

- a) BS\_PBCCH\_BLKES, that defines the number of CPBCCH blocks per multiframe, according to the ordered list described in subclause 6.3.2.1, on the radio frequency channel that carries CPBCCH;
- b) BS\_PAG\_BLKES\_RES, that defines the number of blocks in addition to BS\_PBCCH\_BLKES, where CPPCH shall not occur on every radio frequency channel that carries CPCCCH. These blocks without CPPCH are allocated after CPPCH blocks according to the ordered list described in subclause 6.3.2.1.

CPCCCH (except CPPCH) can be mapped on all blocks except those used for CPBCCH.

For primary COMPACT carriers, CPCCCHs shall be allocated on the same time group as CPBCCH. CPCCCHs on secondary COMPACT carrier(s) shall be allocated on same time group as for primary COMPACT carrier.

See Annex D for examples based on three CPCCCH blocks.

#### 6.3.2.4 Mapping of PBCCH data

In order to facilitate the MS operation, the network is required to transmit certain types of Packet System Information (PSI) messages in specific multiframe and specific PBCCH blocks within the multiframe. The occurrence of the PSI1 message is defined by  $TC = (FN \text{ DIV } 52) \text{ mod } \text{PSI1\_REPEAT\_PERIOD}$ , where  $\text{PSI1\_REPEAT\_PERIOD}$  (range 1 - 16) is indicated in the SI13 message on BCCH, the PSI 1 message on PBCCH and, if present, in the Neighbour Cell parameters in PSI3 and PSI3bis messages sent on serving cell PBCCH.

The PSI1 message is transmitted at  $TC = 0$  according to rule i) and ii) below.

The PSI messages other than the PSI1 message are divided into two groups of PSI messages. One group of PSI messages is transmitted with a low repetition rate and a second group is transmitted with a high repetition rate.

The number of PSI message instances sent with high repetition rate is indicated by the parameter  $\text{PSI\_COUNT\_HR}$  (range 0 to 16) in the PSI1 message. The PSI messages in this group are sent according to rule iii) below.

The number of PSI message instances sent with low repetition rate is indicated by the parameter  $\text{PSI\_COUNT\_LR}$  (range 0 to 63) in the PSI1 message. The PSI messages in this group are sent according to rule iv) below.

The following rules apply:

- i) PSI1 shall be sent in block B0 when  $TC = 0$ ;
- ii) if the value of the parameter BS\_PBCCH\_BLKES is greater than 1, the PSI1 shall also be sent in block B6 when  $TC = 0$ ;
- iii) the PSI messages in the group sent with high repetition rate shall be sent in a sequence determined by the network and starting at  $TC = 0$ , using the PBCCH blocks within each multiframe, in the order of occurrence, which are not occupied according to rule i) or ii). The sequence of these PSI messages shall be repeated starting at each occurrence of  $TC = 0$ ;
- iv) the PSI messages in the group sent with low repetition rate shall be sent in a sequence determined by the network and continuously repeated, using the PBCCH blocks within each multiframe, in the order of occurrence, which are not occupied according to rules i) to iii). The sequence of these PSI messages shall be restarting at  $FN = 0$ .

If there are multiple instances of a particular type of PSI message (see 3GPP TS 44.060), they shall all be sent within same group of PSI messages according to either rule iii) or iv) above. They shall be sent in a single sequence in the ascending order of the message instance number of that type of PSI message.

The same PSI message shall not occur twice within the lists defined by PSI\_COUNT\_LR and PSI\_COUNT\_HR

A full set of Packet System Information messages contains one consistent set of the messages included in PSI\_COUNT\_LR and one consistent set of the messages included in PSI\_COUNT\_HR plus the PSI1 message.

NOTE: The parameters BS\_PBCCH\_BLKs and PSI1\_REPEAT\_PERIOD shall be selected by the network such that all PSI message present in the cell can be sent according to rules i) to iv) above. It is the responsibility of the network to optimise the broadcast of the PSI messages so that the MS can find the important parameters for cell re-selection and access as fast as possible without unnecessary power consumption. The PSI mapping scheme information can be utilised by the MS to estimate the actual minimum cell reselection time.

#### 6.3.2.4a Mapping of COMPACT CPBCCCH data

See subclause 6.3.2.4, with the exception that the CPBCCCH is a stand-alone packet control channel for COMPACT.

### 6.3.3 Mapping in time of CTS control channels onto physical channels

The mapping in time of CTS control channels is defined in table 8 of clause 7, which also defines the relationship of the air interface TDMA frames to the multiframe.

The timeslot assignment of the CTS control channel is defined hereafter.

#### 6.3.3.1 CTSBCH timeslot assignment

For the CTSBCH, a procedure of timeslot shifting from one 52-multiframe to another is defined. The usage of this procedure is mandatory in CTS idle mode and optional in CTS dedicated mode. When the shifting procedure is not applied, the CTSBCH timeslot number shall be equal to the TNC broadcast in the current 52-multiframe CTSBCH-SB.

The following parameters are required for the timeslot shifting procedure.

Parameters broadcast in the CTSBCH-SB:

- a) TNI: initial timeslot number (0 to 7, 3 bits), defined by the three LSBs (BN3, BN2, BN1) of the FPBI (specified in 3GPP TS 23.003);
- b) TNSCN: timeslot number series couple number (0 to 31, 5 bits), defined by the 5 bits (BN8, ..., BN4) of the FPBI. Defines the couple of timeslot number circular series ( $TNS_{TNSCN,0}$ ,  $TNS_{TNSCN,1}$ ) to be used to form the timeslot shifting sequence. See timeslot number series (TNS) definition in table below.

Table 1 (subclause 6.3.3):  $TNS_{i,j}$  definition

TNSCN	$TNS_{TNSCN,0}$	$TNS_{TNSCN,1}$	TNSCN	$TNS_{TNSCN,0}$	$TNS_{TNSCN,1}$
0	(0, 1, 2, 4, 7, 5, 6, 3)	(0, 3, 5, 7, 6, 2, 1, 4)	16	(0, 1, 5, 6, 7, 4, 3, 2)	(0, 4, 7, 6, 2, 5, 1, 3)
1	(0, 1, 2, 5, 3, 6, 7, 4)	(0, 4, 1, 5, 7, 6, 3, 2)	17	(0, 2, 1, 3, 6, 7, 5, 4)	(0, 3, 7, 4, 1, 5, 6, 2)
2	(0, 1, 2, 6, 5, 3, 7, 4)	(0, 3, 6, 7, 5, 2, 4, 1)	18	(0, 2, 1, 5, 6, 7, 4, 3)	(0, 4, 7, 5, 1, 3, 6, 2)
3	(0, 1, 2, 6, 7, 5, 4, 3)	(0, 3, 7, 4, 6, 2, 5, 1)	19	(0, 2, 3, 4, 7, 6, 5, 1)	(0, 3, 1, 5, 2, 6, 7, 4)
4	(0, 1, 3, 2, 5, 6, 7, 4)	(0, 4, 7, 6, 2, 1, 5, 3)	20	(0, 2, 3, 6, 7, 5, 1, 4)	(0, 4, 7, 6, 3, 5, 2, 1)
5	(0, 1, 3, 6, 7, 5, 2, 4)	(0, 3, 7, 4, 2, 6, 5, 1)	21	(0, 2, 3, 7, 5, 6, 4, 1)	(0, 3, 6, 2, 1, 5, 7, 4)
6	(0, 1, 4, 2, 5, 6, 7, 3)	(0, 2, 6, 3, 7, 5, 4, 1)	22	(0, 2, 4, 7, 3, 6, 5, 1)	(0, 3, 5, 6, 7, 4, 1, 2)
7	(0, 1, 4, 2, 5, 7, 6, 3)	(0, 4, 7, 3, 5, 6, 2, 1)	23	(0, 2, 5, 3, 6, 7, 4, 1)	(0, 3, 7, 6, 5, 1, 2, 4)
8	(0, 1, 4, 2, 6, 5, 7, 3)	(0, 2, 1, 5, 3, 6, 7, 4)	24	(0, 2, 5, 3, 7, 6, 4, 1)	(0, 3, 5, 1, 2, 6, 7, 4)
9	(0, 1, 4, 5, 7, 3, 6, 2)	(0, 3, 7, 6, 5, 2, 4, 1)	25	(0, 2, 6, 3, 1, 5, 7, 4)	(0, 3, 4, 7, 6, 5, 1, 2)
10	(0, 1, 4, 6, 5, 7, 3, 2)	(0, 4, 7, 5, 1, 2, 6, 3)	26	(0, 2, 6, 5, 1, 4, 7, 3)	(0, 4, 5, 7, 6, 3, 1, 2)
11	(0, 1, 4, 7, 3, 5, 6, 2)	(0, 4, 2, 1, 5, 7, 6, 3)	27	(0, 2, 6, 5, 3, 7, 4, 1)	(0, 3, 6, 7, 5, 1, 2, 4)
12	(0, 1, 4, 7, 6, 3, 5, 2)	(0, 4, 2, 1, 5, 6, 7, 3)	28	(0, 3, 5, 1, 2, 6, 7, 4)	(0, 4, 7, 6, 5, 2, 3, 1)
13	(0, 1, 5, 2, 4, 7, 6, 3)	(0, 3, 7, 5, 1, 4, 6, 2)	29	(0, 3, 5, 2, 6, 7, 4, 1)	(0, 4, 7, 3, 6, 5, 1, 2)
14	(0, 1, 5, 2, 6, 4, 7, 3)	(0, 3, 4, 5, 7, 6, 2, 1)	30	(0, 3, 6, 7, 4, 2, 5, 1)	(0, 4, 1, 2, 6, 5, 7, 3)
15	(0, 1, 5, 6, 2, 4, 7, 3)	(0, 3, 7, 6, 4, 5, 2, 1)	31	(0, 3, 7, 5, 6, 2, 4, 1)	(0, 4, 7, 6, 3, 5, 1, 2)

Parameters sent on a dedicated connection during the CTS-MS attachment:

- a) TNSCO : TNS couple order (1 bit), defines together with TNSCN the ordered couple (TNS1, TNS2).  
 if TNSCO = 0 then (TNS1, TNS2) = ( $TNS_{TNSCN,0}$ ,  $TNS_{TNSCN,1}$ )  
 if TNSCO = 1 then (TNS1, TNS2) = ( $TNS_{TNSCN,1}$ ,  $TNS_{TNSCN,0}$ )
- b) parameters to be used to form the timeslot shifting sequence.  
 x0 : 0 to 7, 3 bits  
 x1 : 0 to 7, 3 bits  
 x2 : 0 to 7, 3 bits  
 x3 : 0 to 7, 3 bits

For a given set of parameters, a unique timeslot shifting sequence of length of 8 x 51 52-multiframes is defined. The shifting sequence is repeated 128 times over the duration of a GSM hyperframe. It is divided into 8 sets of 51 52-multiframes. The structure of a set is explicitly shown on figure below :

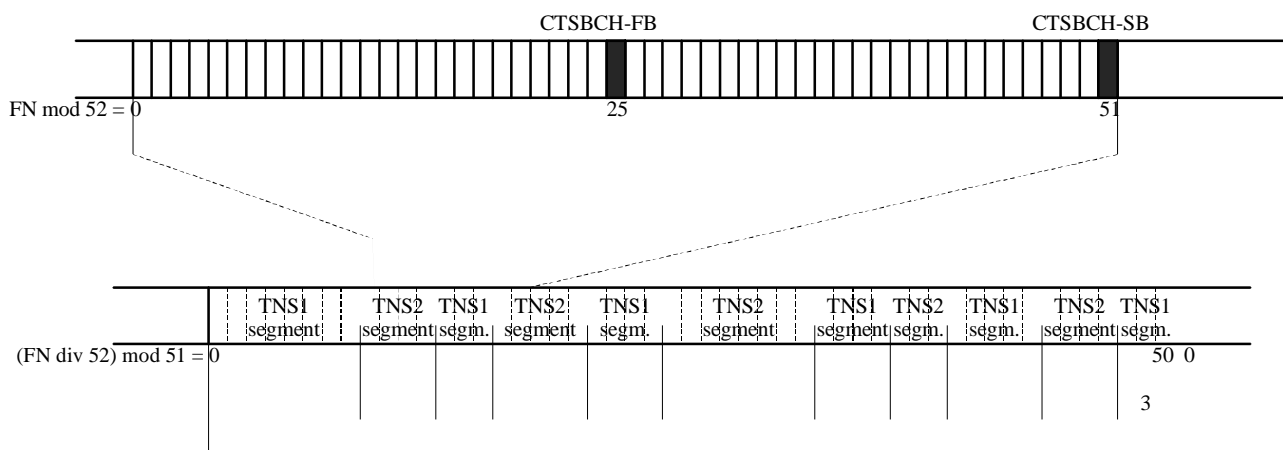

Figure 1 (subclause 6.3.3): Structure of timeslot shifting sequence

A set is formed by interleaving segments of TNS1 and TNS2. The mapping of TNS1 and TNS2 segments onto a set is defined by the parameters x0, x1, x2, x3 as follows :

for  $(FN \div 52) \bmod 51 = 0$  to 7 a TNS1 segment is used

for (FN div 52) mod 51 = 8	to 7+x3	a TNS2 segment is used
for (FN div 52) mod 51 = 8+x3	to 7+x3+x2	a TNS1 segment is used
for (FN div 52) mod 51 = 8+x3+x2	to 7+x3+x2+x1	a TNS2 segment is used
for (FN div 52) mod 51 = 8+x3+x2+x1	to 7+x3+x2+x1+x0	a TNS1 segment is used
for (FN div 52) mod 51 = 8+x3+x2+x1+x0	to 15+x3+x2+x1+x0	a TNS2 segment is used
for (FN div 52) mod 51 = 16+x3+x2+x1+x0	to 23+x3+x2+x1	a TNS1 segment is used
for (FN div 52) mod 51 = 24+x3+x2+x1	to 31+x3+x2	a TNS2 segment is used
for (FN div 52) mod 51 = 32+x3+x2	to 39+x3	a TNS1 segment is used
for (FN div 52) mod 51 = 40+x3	to 47	a TNS2 segment is used
for (FN div 52) mod 51 = 48	to 50	a TNS1 segment is used

The TNS1 and TNS2 segments are extracted from TNS1 and TNS2 according to the following rules :

- The first CTSBCH TN used in a shifting sequence shall be the TNI.
- Two consecutive CTSBCH TN shall be separated by single circular shifts along TNS1 and TNS2.
- When changing from a TNS<sub>i</sub> segment to a TNS<sub>j</sub> segment, the last timeslot obtained from TNS<sub>i</sub> shall be followed by its immediate successor in TNS<sub>j</sub>.

NOTE: The first timeslot of a set is obtained by three circular shifts in TNS1 with regard to the first timeslot of the previous set.

An example of the mapping of TNS1 and TNS2 onto the first set of the generated shifting sequence is given in annex C.

### 6.3.3.2 CTSPCH, CTSARCH and CTSAGCH timeslot assignment

For the CTSPCH, CTSARCH and CTSAGCH, the timeslot shall be assigned by the CTS-FP for each 52-multiframe. The timeslot number used for CTSPCH, CTSARCH and CTSAGCH shall be the TNC broadcast in the previous 52-multiframe CTSBCH-SB.

## 6.4 Permitted channel combinations

### 6.4.1 Permitted channel combinations onto a basic physical channel

The following are the permitted ways, as defined by 3GPP TS 44.003, in which channels can be combined onto basic physical channels for one or several MSs.

The following definitions are used in the list of combinations below.

<u>Combination designation</u>	<u>Channel combination</u>
SUB_TA	TCH/H + FACCH/H + SACCH/TH
SUB_T	TCH/H
SUB_PA	PDTCH/H + PACCH/H
SUB_TE	TCH/H + FACCH/H + SACCH/TPH + EPCCH/H
SUB_OTA	O-TCH/H + O-FACCH/H + SACCH/TH
SUB_OT	O-TCH/H

SUB\_OTE            O-TCH/H + O-FACCH/H + SACCH/TPH + EPCCH/H

Numbers appearing in parenthesis after channel designations indicate sub-channel numbers. (0..n) shall be interpreted as subchannel 0, 1,...,n-1 and n. Channels and sub-channels need not necessarily be assigned.

- i) TCH/F + FACCH/F + SACCH/TF
- ii) O-TCH/F + O-FACCH/F + SACCH/TF
- iii)
- iv) FCCH + SCH + BCCH + CCCH

xxxvi) PDTCH/U + PACCH/U + PTCCH/U + MPRACH

The following combinations of half rate channels are allowed on a basic physical channel for a single mobile, where the second half rate channel need not be assigned:

- a1) SUB\_TA + SUB\_T (Lm + Lm configuration)
- a2) SUB\_TA + SUB\_OT (Lm + Lm configuration)
- a3) SUB\_TA + SUB\_PA (DTM single slot)
- a4) SUB\_TE + SUB\_T (Lm + Lm configuration)
- a5) SUB\_TE + SUB\_OT (Lm + Lm configuration)
- a6) SUB\_TE + SUB\_PA (DTM single slot)
- a7) SUB\_OTA + SUB\_OT (Lm + Lm configuration)
- a8) SUB\_OTA + SUB\_T (Lm + Lm configuration)
- a9) SUB\_OTA + SUB\_PA (DTM single slot)
- a10) SUB\_OTE + SUB\_OT (Lm + Lm configuration)
- a11) SUB\_OTE + SUB\_T (Lm + Lm configuration)
- a12) SUB\_OTE + SUB\_PA (DTM single slot)

The following combinations of half rate channels are allowed on a basic physical channel for two mobiles:

- b1) SUB\_TA + SUB\_TA
- b2) SUB\_TA + SUB\_TE
- b3) SUB\_TA + SUB\_OTA
- b4) SUB\_TA + SUB\_OTE
- b5) SUB\_TE + SUB\_TE
- b6) SUB\_TE + SUB\_OTA
- b7) SUB\_TE + SUB\_OTE
- b8) SUB\_OTA + SUB\_OTA
- b9) SUB\_OTA + SUB\_OTE
- b10) SUB\_OTE + SUB\_OTE

NOTE 0: CCCH = PCH+ RACH + AGCH + NCH.

PCCCH = PPCH+PRACH+PAGCH

CPCCCH = CPPCH + CPRACH + CPAGCH

NOTE 1: Where the SMSCB is supported, the CBCH replaces SDCCH number 2 in cases v) and vii) above.

NOTE 2: A combined CCCH/SDCCH allocation (case v) above) may only be used when no other CCCH channel is allocated.

- NOTE 3: Combinations viii), ix), x), xix), xx), xxi), xxix), xxx), xxxi) and xxxii) are used without EPC in multislot configurations as defined in subclause 6.4.2.
- NOTE 4: Combinations xiv), xv), xvi) and xvii) shall be used in CTS; combinations xiv), xvi) and xvii) shall be mutually exclusive; combinations xiv) and xv) shall also be mutually exclusive.
- NOTE 5: Combinations xxii) and xxiii) shall be used for COMPACT on serving time groups.
- NOTE 6: Combinations i), ii), xiii), xxv), xxiv) or any of a1) to a12) shall be used for single timeslot operation in DTM.
- NOTE 7: A unidirectional TCH combination i), viii), ix) or x) may be combined with the corresponding E-TCH combination xviii), xix), xx) or xxi) respectively in the other direction.
- NOTE 8: Combinations xxvi), xxvii), xxviii), xxxii), xxxiii) and xxxiv) are used with EPC in multislot configurations as defined in subclause 6.4.2.
- NOTE 9: The basic physical channel onto which channels can be combined according to combinations i), ii), viii), ix), x), xviii), xix), xx), xxi), xxiv), xxv), xxvi), xxvii), xxviii), xxix), xxx), xxxi), xxxii), xxxiii) and xxxiv) is referred to as dedicated basic physical subchannel full rate (DBPSCH/F) in *Iu mode*.
- NOTE 10: The basic physical channel onto which channels can be combined according to combinations xi), xii) and xiii) is referred to as shared basic physical subchannel full rate (SBPSCH/F) in *Iu mode*.
- NOTE 11: The part of the basic physical channel onto which channels can be combined according to combinations SUB\_TA, SUB\_T, SUB\_PA, SUB\_TE, SUB\_OTA, SUB\_OT, SUB\_OTE is referred to as dedicated basic physical subchannel half rate (DBPSCH/H) in *Iu mode*.
- NOTE 12: The part of the basic physical channel onto which channels can be combined according to combination SUB\_PA is referred to as shared basic physical subchannel half rate (SBPSCH/H) in *Iu mode*.
- NOTE 13: The parts of the basic physical channel onto which SDCCH and SACCH can be combined according to combination v) are referred to as dedicated basic physical subchannels for SDCCH/4 and SACCH/C4 (DBPSCH/S4) in *Iu mode*.
- NOTE 14: The parts of the basic physical channel onto which SDCCH and SACCH can be combined according to combination vii) are referred to as dedicated basic physical subchannels for SDCCH/8 and SACCH/C8 (DBPSCH/S8) in *Iu mode*.
- NOTE 15: Combinations xxxv) and xxxvi) are used only for MBMS.
- NOTE 16: For RTTI configurations only combination xiii) shall be used.

## 6.4.2 Multislot configurations

A multislot configuration consists of multiple circuit or packet switched traffic channels together with associated control channels, assigned to the same MS or, in the case of point-to-multipoint transmission, a group of MSs. The multislot configuration occupies up to 8 basic physical channels, with different timeslots numbers (TN) but with the same frequency parameters (ARFCN or MA, MAIO and HSN) and the same training sequence (TSC).

### 6.4.2.1 Multislot configurations for circuit switched connections in *A/Gb mode*

In *A/Gb mode*, two types of multislot configurations exist, symmetric and asymmetric. The symmetric case consists of only bi-directional channels. The asymmetric case consists of both bi-directional and unidirectional downlink channels.

The occupied physical channels shall consist of the following channel combinations as defined in subclause 6.4.1.

- one main channel of type viii) or xix) +
- x secondary channels of type ix) or xx) +
- y secondary channels of type x) or xxi)

When in EPC mode (see 3GPP TS 45.008) the occupied physical channels shall consist of the following channel combinations as defined in subclause 6.4.1.

one main channel of type xxvi) +  
 x secondary channels of type xxvii) +  
 y secondary channels of type xxviii)

where  $0 \leq x \leq 7, y = 0$  for symmetric multislot configuration  
 $0 \leq x \leq 6, 1 \leq y \leq 7, x+y \leq 7$  for asymmetric multislot configuration

The main channel is the bi-directional channel that carries the main signalling (FACCH and SACCH) for the multislot configuration. The position of the main channel is indicated by the assignment message (3GPP TS 44.018). Secondary channels may be added or removed without changing the main channel.

The assignment of channels to a Multislot Configuration must always consider the multislot capability of the MS, as defined by the multislot class described in annex B.

There is no limitation in this TS to the possible TCH types (see subclause 3.2) which may be used in a Multislot Configuration.

High Speed Circuit Switched Data (HSCSD) is one case of multislot configuration. The full rate traffic channels of a HSCSD configuration shall convey the same user bit rate (see subclause 3.2.3).

NOTE: For the maximum number of timeslots to be used for a HSCSD, see 3GPP TS 23.034.

#### 6.4.2.2 Multislot configurations for packet switched connections in *A/Gb mode*

In *A/Gb mode*, an MS may be assigned several PDTCH/Us or PDTCH/Ds for one mobile originated or one mobile terminated communication respectively, mapped onto a corresponding number of PDCHs or, in the case of RTTI configurations, of PDCH-pairs. The total number of assigned uplink PDCHs and downlink PDTCHs shall not exceed the total number of uplink and downlink timeslots that can be used by the MS per TDMA frame (i.e., the parameter "Sum" specified in Annex B). In this context "assignment" refers to the list of PDCH given in the assignment message and that may dynamically carry the PDTCHs for that specific MS. Alternatively, for a multislot class type 1 MS supporting Flexible Timeslot Assignment (see 3GPP TS 24.008) the network may assign a total number of uplink and downlink PDCHs exceeding the parameter "Sum" specified in Annex B, provided that the number of assigned downlink PDCHs shall not exceed the number of downlink timeslots that can be used by the MS per TDMA frame (i.e., the parameter "Rx" specified in Annex B) and the number of assigned uplink PDCHs shall not exceed the number of uplink timeslots that can be used by the MS per TDMA frame (i.e., the parameter "Tx" specified in Annex B). In this case, the network shall ensure that, in each radio block period, the total number of uplink and downlink PDCHs that have been allocated to the MS does not exceed the total number of uplink and downlink timeslots that can be used by the MS per TDMA frame (i.e., the parameter "Sum" specified in Annex B).

NOTE: In the downlink, a PDCH is "allocated" to an MS in a radio block period if the network transmits an RLC/MAC block for the MS on that PDCH during that radio block period.

In the case of RTTI configurations, PDCHs shall be assigned in pairs.

If there are m timeslots assigned for reception and n timeslots assigned for transmission:

- For a multislot class type 1 MS, there shall be  $\text{Min}(m,n,2)$  reception and transmission timeslots with the same TN;
- For a multislot class type 2 MS, there shall be  $\text{Min}(m,n)$  reception and transmission timeslots with the same TN.

In the case of downlink dual carrier configurations, if timeslots with the same timeslot number are assigned on both carriers, in calculating the value of m they shall be counted as one timeslot.

The mapping of PACCH onto the assigned downlink PDCHs or the allocated uplink PDCHs is specified in 3GPP TS 44.060.

For multislot class type 1 MS, Table 6.4.2.2.1 lists the number of timeslots that are possible to assign (provided that it is supported by the MS according to its multislot class) for different medium access modes (see 3GPP TS 44.060). It also indicates if the network shall apply  $T_{ra}$  or  $T_{ta}$  (see annex B), and if Shifted USF operation shall apply (see 3GPP TS 44.060). Additionally, it indicates which configurations can also be used for allocation (provided that they are compatible with the number of timeslots assigned to the MS).

Note: In case of extended dynamic allocation, the MS needs to support USF monitoring on the downlink PDCHs corresponding to (i.e. with the same timeslot number as) all assigned uplink PDCHs as defined in 3GPP TS 44.060.

In a dual carrier configuration, all the downlink timeslots on both radio frequency channels shall be assigned within a window of size "d" where "d" is defined in Table 6.4.2.2.1. The maximum number of timeslots that may be assigned depends on the multislot class of the MS (or the Equivalent multislot class if different from the Signalled multislot class as described in B.4).

**Table 6.4.2.2.1: Multislot configurations for packet switched connections in A/Gb mode**

Medium access mode	No of Slots (Note 0)	$T_{ra}$ shall apply	$T_{ia}$ shall apply	Applicable Multislot classes (see Note 7)	Note
Downlink, any mode	d = 1-6	Yes	-	1-12, 19-45	
	d = 7-8	No	-	24-29	1,2
Uplink, Dynamic	u = 1-2	Yes	-	1-12, 19-45	
Uplink, Ext. Dynamic	u = 1-3	Yes	-	1-12, 19-45	
	u = 4	-	Yes	12, 22-23, 27-29	2
	u = 4	Yes	-	33-34, 38-39, 43-45	2
	u = 5	Yes	-	34, 39	2,3,5
	u = 5	-	Yes	44-45	2,4
	u = 6	-	Yes	45	2,4,5
Down + up, Dynamic	d+u = 2-5, u < 3	Yes	-	1-12, 19-45	
	d+u = 6, u < 3	Yes	-	30-45	2,3
	d+u = 7, u < 3	-	Yes	40-45	2,4
	d = 2, u = 3	Yes	-	11-12, 30-45	9
	d+u = 6, u = 3-4	Yes	-	32-34,37-39,42-45	2,3,9
	d+u = 7, u = 3-4	-	Yes	42-45	2,4,9
	d = 4, u = 4	Yes	-	33-34,38-39,43-45	2,3,8,9
	d = 4, u = 5	-	Yes	44-45	2,4,8,9
Down + up, Ext. Dynamic	d+u = 2-4	Yes	-	1-12, 19-45	
	d+u = 5, d > 1	Yes	-	8-12, 19-45	
	d+u = 6-7, u < 4	Yes	-	10-12	8
	d = 1, u = 4	-	Yes	12, 22-23, 27-29	2
	d > 1, u = 4	-	Yes	12	2,8
	d = 1, u = 4	Yes	-	33-34, 38-39, 43-45	2,6
	d+u = 6, d > 1	Yes	-	30-45	2,3
	d = 1, u = 5	Yes	-	34,39	2,3,5
	d+u = 7-9, u < 5	Yes	-	31-34, 36-39	2,3,8
	d > 1, u = 5	Yes	-	34,39	2,3,5,8
	d = 1, u = 5	-	Yes	44-45	2,4
	d+u = 7, d > 1	-	Yes	40-45	2,4
	d = 1, u = 6	-	Yes	45	2,4,5
	d+u = 8-11, u < 6	-	Yes	41-45	2,4,8
	d > 1, u = 6	-	Yes	45	2,4,5,8
Note 0	If the downlink timeslots assigned (allocated) to the mobile station are not contiguous, d shall also include the number of downlink timeslots not assigned (allocated) to the mobile station that are located between assigned (allocated) downlink timeslots. Similarly, if the uplink timeslots assigned (allocated) to the mobile station are not contiguous, u shall also include the number of uplink timeslots not assigned (allocated) to the mobile station that are located between assigned (allocated) uplink timeslots.				
Note 1	Normal measurements are not possible (see 3GPP TS 45.008).				
Note 2	Normal BSIC decoding is not possible (see 3GPP TS 45.008) except e.g. in case of a downlink dual carrier capable MS operating in single carrier mode using its second receiver for BSIC decoding.				
Note 3	TA offset required for multislot classes 35-39.				
Note 4	TA offset required for multislot classes 40-45.				
Note 5	Shifted USF operation shall apply (see 3GPP TS 44.060).				
Note 6	The network may fallback to a lower multislot class and may not apply $T_{ra}$ . A multislot class 38 or 39 MS shall in this case use $T_{ia}$ for timing advance values below 31.				
Note 7	For dual carrier operation the Applicable Multislot class is the Signalled multislot class or the Equivalent multislot class (if different from the Signalled multislot class) as defined in Table B.2.				
Note 8	These configurations can only be used for assignment to an MS supporting Flexible Timeslot Assignment (see 3GPP TS 24.008). For allocation additional restrictions apply.				
Note 9	These configurations can be used only in case of RTTI configurations.				

For multislot class type 2 MS, all assignments according to its multislot class are possible independent of the MAC mode.

The occupied physical channels shall consist of a combination of configurations xi, xii and xiii as defined in subclause 6.4.1. For COMPACT, the occupied physical channels shall consist of a combination of configurations xiii), xxii), and xxiii), as defined in subclause 6.4.1.

The network shall leave a gap of at least one radio block period between the old and the new configuration, when the assignment is changed and PDCHs with the lowest numbered timeslot are not the same in the old and new configuration. For multislot class type 1 MS, the gap shall be left in both uplink and downlink when the lowest numbered timeslot for the combined uplink and downlink configuration is changed. For multislot class type 2 MS, the gap shall be left in the link (uplink and/or downlink) where the lowest numbered timeslot has been changed.

### 6.4.2.3 Multislot configurations for dual transfer mode in *A/Gb mode*

For DTM in *A/Gb mode*, a multislot configuration consists of a single traffic channel (TCH, O-TCH or E-TCH) and one or more packet data traffic channels (PDTCH) together with associated control channels assigned to the same mobile station. The mix of full and half rate packet data channels is not allowed in the uplink. This mix is only defined for the downlink direction and only supported by mobile stations indicating Extended GPRS DTM Multi Slot Class or Extended EGPRS DTM Multi Slot Class capability (see 3GPP TS 24.008). The PDTCH/H is only allowed on the time slot assigned for half rate circuit switched connection.

**Note:** In the case of extended dynamic allocation, the MS needs to support USF monitoring on the downlink PDCHs corresponding to (i.e. with the same timeslot number as) all assigned uplink PDCHs, as defined in 3GPP TS 44.060. This also restricts multislot configurations where USF monitoring is not possible for all assigned uplink PDCHs because of the presence of the dedicated channel. As an exception, if the mobile station indicates support of DTM high multislot class capability, the network may assign a multislot configuration where USF monitoring is not possible for all assigned uplink PDCHs because of the presence of the dedicated channel. In this case, the mobile station behaves as described in 3GPP TS 44.060.

A mobile station indicating support of Flexible Timeslot Assignment (see 3GPP TS 24.008) shall support Flexible Timeslot Assignment while in dual transfer mode.

The network shall leave a gap of at least one radio block between the old and the new configuration, when the assignment is changed and PDCHs with the lowest numbered timeslot are not the same in the old and new configuration. For multislot class type 1 MS, the gap shall be left in both uplink and downlink when the lowest numbered timeslot for the combined uplink and downlink configuration is changed.

#### 6.4.2.3a Multislot configurations for MBMS in *A/Gb mode*

In *A/Gb mode*, the network may assign several PDTCH/Ds for one broadcast/multicast session (see 3GPP TS 44.060). The total number of assigned PDTCH/Ds for one broadcast/multicast session shall not exceed 5 (4 if the MS must listen to the (P)BCCH and (P)CCCH in addition to the timeslots allocated for MBMS data transfer). In this context 'assignment' refers to the list of PDCHs given in the assignment message and that may dynamically carry the PDTCHs. The PACCH/D may be mapped onto any of the assigned PDCHs.

An MBMS capable mobile station shall be capable of receiving one or more broadcast/multicast sessions on up to 5 contiguous timeslots within a TDMA frame (4 if the MS must listen to the (P)BCCH and (P)CCCH in addition to the timeslots assigned for MBMS data transfer). If the timeslots are not contiguous, the number of downlink timeslots not listened to by the mobile station that are located between downlink timeslots that are listened to shall also be included in this number.

**NOTE 1:** When receiving multiple broadcast/multicast sessions, the number of sessions that the mobile station can simultaneously receive depends on the radio resources assignment for the corresponding MBMS radio bearers.

As an exception in the case where the mobile station needs to listen to the (P)BCCH and (P)CCCH in addition to the timeslots assigned for MBMS data transfer, if PBCCH is present in the cell and BS\_PCC\_CHANS=1, the total number of PDTCH/Ds assigned for one broadcast/multicast session may equal 5 (including the PDTCH/D carried on the PDCH where PBCCH/PCCCH is mapped on). An MBMS capable mobile station shall then be capable of receiving one or more broadcast/multicast sessions on up to 5 contiguous timeslots within a TDMA frame, and in addition listen to the (P)BCCH and (P)CCCH, if the following conditions are met:

- the PDCH where PBCCH/PCCCH is mapped on is adjacent to the other PDCHs assigned for the MBMS radio bearer(s); and
- the same frequency parameters apply over the 5 PDCHs.

Additionally, up to one uplink timeslot per broadcast/multicast session may be assigned for PACCH/U. The timeslot allocated for transmission shall have the same TN as one of the timeslots used for reception. A multislot class type 1 MS receiving more than one broadcast/multicast session may transmit on up to two uplink timeslots, depending on the radio resources assigned for the MBMS radio bearers. The number ( $m$ ) of timeslots listened to by the mobile station for the reception of one or more broadcast/multicast sessions and the number ( $n$ ) of timeslots used by the mobile station for the transmission on PACCH/U within a TDMA frame shall be such that the sum of  $m$  and  $n$  does not exceed 6 (5 in case the mobile station needs to listen to the (P)BCCH and (P)CCCH in addition to the timeslots assigned for MBMS data transfer and the exception described in this sub-clause does not apply).

While in broadcast/multicast receive mode, an MBMS-capable MS shall be capable of receiving, in addition to the timeslots assigned for data transfer, on at least one further timeslot in order to read the BCCH and CCCH or the PBCCH and PCCCH (with the exception described in this sub-clause, where the timeslot carrying the PBCCH and PCCCH is one of the timeslots assigned for data transfer). This requirement does however not apply when the network transmits system information and paging messages on the PACCH of the MBMS radio bearer (see sub-clause 6.5.1, item xxii). The maximum number of timeslots that an MS is required to receive upon within a TDMA frame is 5, and the timeslots shall be assigned within a window of maximum size  $R_x=6$ . The number of PDTCH/Ds assigned and their TN shall be such that an MS receiving a given broadcast/multicast session shall be able to read the BCCH and CCCH or the PBCCH and PCCCH without interrupting the reception of the broadcast/multicast session and the transmission on the uplink timeslot, if assigned, unless system information and paging messages are sent on the PACCH of the MBMS radio bearer. Depending on the number of CCCH or PCCCH allocated in the cell, the network may need to restrict the number of PDTCH/Ds assigned to one broadcast/multicast session.

For an MBMS capable mobile station, the minimum requirements shall be  $R_x=6$ ,  $T_x=2$ ,  $\text{Sum}=6$ ,  $T_{ra}=T_{tb}=T_{ra}=T_{rb}=1$ .

#### 6.4.2.4 Multislot configurations for DBPSCH in *lu mode*

##### 6.4.2.4.1 TCHs assigned

For a multislot class type 1 MS supporting MBMS, the values of  $T_{tb}$  and  $T_{ra}$  shall be equal to 1 (i.e. multislot classes 31-34, 41-45, see Annex B).

NOTE 2: Multislot classes 30 and 40 are not included since the corresponding mobile stations cannot transmit on up to two uplink timeslots.

##### 6.4.2.4.2 PDTCHs assigned

In *lu mode*, two types of multislot configurations exist, symmetric and asymmetric. The symmetric case consists of only bi-directional basic physical subchannels. The asymmetric case consists of both bi-directional and unidirectional downlink basic physical subchannels.

The occupied physical channels shall consist of the following channel combinations as defined in subclause 6.4.1.

x channels of type xxxi) +  
y channels of type xxxii)

When in EPC mode (see 3GPP TS 45.008) the occupied physical channels shall consist of the following channel combinations as defined in subclause 6.4.1.

x channels of type xxxiii) +  
y channels of type xxxiv)

where  $1 \leq x \leq 8$ ,  $y = 0$  for symmetric multislot configuration

$1 \leq x \leq 7$ ,  $1 \leq y \leq 7$ ,  $x+y \leq 8$  for asymmetric multislot configuration

The assignment of channels to a Multislot Configuration must always consider the multislot capability of the MS, as defined by the multislot class described in annex B.

#### 6.4.2.4.3 TCHs and PDTCHs assigned

Multislot configurations for DBPSCH may consist of a mixed assignment of TCHs and PDTCHs. The multislot configurations for TCH and PDTCH on DBPSCH in *Iu mode* are defined in sections 6.4.2.4.1 and 6.4.2.4.2.

#### 6.4.2.5 void

#### 6.4.2.6 Multislot configurations for SBPSCH in *Iu mode*

The multislot configurations for SBPSCH in *Iu mode* are equivalent to the multislot configurations for packet switched connections in *A/Gb mode*, which are defined in section 6.4.2.2.

#### 6.4.2.7 Multislot configurations for dual transfer mode in *Iu mode*

For dual transfer mode in *Iu mode*, a multislot configuration comprises one or more DBPSCHs and one or more SBPSCH/F. The mobile station shall support every combination of these basic physical subchannels consistent with its multislot capability signalled to the GERAN (See TS 44.118).

The network shall leave a gap of at least one radio block between the old and the new configuration, when the assignment is changed and SBPSCHs with the lowest numbered timeslot are not the same in the old and new configuration. For multislot class type 1 MS, the gap shall be left in both uplink and downlink when the lowest numbered timeslot for the combined uplink and downlink configuration is changed.

## 6.5 Operation of channels and channel combinations

### 6.5.1 General

- i) A base transceiver station must transmit a burst in every timeslot of every TDMA frame in the downlink of radio frequency channel C0 of the cell allocation (to allow mobiles to make power measurements of the radio frequency channels supporting the BCCH, see 3GPP TS 45.008). In order to achieve this requirement a dummy burst is defined in subclause 5.2.6 which shall be transmitted by the base transceiver station on all timeslots of all TDMA frames of radio frequency channel C0 for which no other channel requires a burst to be transmitted.
- ii) Timeslot number 0 of radio frequency channel C0 of the cell allocation must support either channel combinations iv) or v) in subclause 6.4.1. No other timeslot or allocated channel from the cell allocation is allowed to support channel combinations iv) or v) in subclause 6.4.1.
- iii) The parameter BS\_CC\_CHANS in the BCCH defines the number of basic physical channels supporting common control channels (CCCHs). All shall use timeslots on radio frequency channel C0 of the cell allocation. The first CCCH shall use timeslot number 0, the second timeslot number 2, the third timeslot number 4 and the fourth timeslot number 6. Each CCCH carries its own CCCH\_GROUP of mobiles in idle mode. Mobiles in a specific CCCH\_GROUP will listen for paging messages and make random accesses only on the specific CCCH to which the CCCH\_GROUP belongs. The method by which a mobile determines the CCCH\_GROUP to which it belongs is defined in subclause 6.5.2.
- iv) The parameter BS\_CCCH\_SDCCH\_COMB in the BCCH (see subclause 3.3.2) defines whether the common control channels defined are combined with SDCCH/4(0.3) + SACCH/C4(0.3) onto the same basic physical channel. If they are combined then the number of available random access channel blocks (access grant channel blocks and paging channel blocks; see following), are reduced as defined in table 5 of clause 7.
- v) The PCH, AGCH, NCH and BCCH Ext may share the same TDMA frame mapping (considered modulo 51) when combined onto a basic physical channel. The channels are shared on a block by block basis, and information within each block, when de-interleaved and decoded allows a mobile to determine whether the block contains paging messages, notification message, system information messages or access grants. However, to ensure a mobile satisfactory access to the system a variable number of the available blocks in each 51-multiframe can be reserved for access grants and system information messages, only. The number of blocks not used for paging (BS\_AG\_BLK\_RES) starting from, and including block number 0 is broadcast in the BCCH (see subclause 3.3.2). As above the number of paging blocks per 51-multiframe considered to be "available" shall be reduced by the number of blocks reserved for access grant messages.

If system information messages are sent on BCCH Ext, BS\_AG\_BLK\_RES shall be set to a value greater than zero.

Table 5 of clause 7 defines the access grant blocks and paging blocks available per 51-multiframe.

- vi) Another parameter in the BCCH, BS\_PA\_MFRMS indicates the number of 51-multiframes between transmissions of paging messages to mobiles in idle mode of the same paging group. The "available" paging blocks per CCCH are then those "available" per 51-multiframe on that CCCH (determined by the two above parameters) multiplied by BS\_PA\_MFRMS. Mobiles are normally only required to monitor every Nth block of their paging channel, where N equals the number of "available" blocks in total (determined by the above BCCH parameters) on the paging channel of the specific CCCH which their CCCH\_GROUP is required to monitor. Other paging modes (e.g. page reorganize or paging overload conditions described in 3GPP TS 44.018) may require the mobile to monitor paging blocks more frequently than this. All the mobiles listening to a particular paging block are defined as being in the same PAGING\_GROUP. The method by which a particular mobile determines to which particular PAGING\_GROUP it belongs and hence which particular block of the available blocks on the paging channel is to be monitored is defined in subclause 6.5.2.
- vii) An MS which has its membership of at least one voice group or voice broadcast call group set to the active state shall, in addition to monitoring the paging blocks as described above, monitor the notification channel, NCH. This logical channel is always mapped onto contiguous blocks reserved for access grants, in a position and number as given by the parameter NCP, defined in 3GPP TS 44.018, broadcast on the BCCH. The channel may be present when a cell supports voice group or voice broadcast calls. The coding of the various structural parameters described above in this subclause is not changed. Information within a block, when deinterleaved and decoded, allows the MS to determine whether the block contains access grant messages or notification messages.
- viii) In presence of PCCCH, the parameter BS\_PCC\_CHANS in the PBCCH defines the number of physical channels for packet data (PDCH) carrying PCCCH. The (P)BCCH shall in addition indicate the physical description of those channels. Each PCCCH carries its own PCCCH\_GROUP of MSs in GPRS attached mode. MS in a specific PCCCH\_GROUP will listen for paging messages and make random accesses only on the specific PCCCH to which the PCCCH\_GROUP belongs. The method by which an MS determines the PCCCH\_GROUP to which it belongs is defined in subclause 6.5.6.
- ix) In CTS, the CTSBCH (CTSBCH-SB and CTSBCH-FB) shall always be transmitted by the CTS-FP according to the rules defined in Clause 6 and table 8 of clause 7.

In CTS idle mode, a CTS-MS shall be assigned a CTS\_PAGING\_GROUP, as specified in subclause 6.5.7. Several CTS-MS can be assigned the same CTS\_PAGING\_GROUP. The CTS-MS shall determine the specific 52-multiframe where a paging block may be sent to it according to the rule defined in subclause 6.5.7, and shall listen to the CTSBCH of the previous 52-multiframe. In this 52-multiframe, the CTS-MS shall decode the CTSBCH-SB information bits : if the flag indicating the presence of a CTSPCH in the next 52-multiframe is properly set (see 3GPP TS 44.056), the CTS-MS shall listen to the next CTSPCH and read the paging block. With this method, it is not necessary to maintain on the physical channel the CTSPCH : the CTSPCH shall only be transmitted when a paging message shall be addressed to one or several CTS-MS in a CTS paging group.

When using the CTSARCH, the CTS-MS shall send two bursts on the CTSARCH: these two bursts shall be sent on two successive frames and shall fulfil the mapping defined in table 8 of clause 7, with the requirement of the first burst being sent in a TDMA frame with even FN. They shall contain the same access request message, which is specified in 3GPP TS 44.056. The first sent burst can be used by the CTS-FP to assess the path loss between the CTS-MS and itself, in order to effectively decode the second burst.

- x) For COMPACT, the base transceiver station shall transmit a burst in a PDCH allocated to carry CPBCCH, in all TDMA Frames where CPBCCH, CFCCH, CSCH is allocated or where CPPCH can appear. In TDMA Frames where CPPCH can appear on the physical channel where CPBCCH is allocated, the base transceiver station shall transmit a dummy block in case no block is required to be transmitted.
- xi) For COMPACT, a base station does not transmit a burst in every timeslot of every TDMA frame in the downlink of the COMPACT control carrier (i.e., discontinuous transmission is used).
- xii) For COMPACT, inter base station time synchronization is required. Timeslot number (TN) =  $i$  ( $i = 0$  to 7) and frame number (FN) with  $FN \bmod 208 = 0$  shall occur at the same time in all cells.

- xiii) For the primary COMPACT carrier, timeslot numbers (TN) 1, 3, 5, and 7 shall support channel combination xxii) in subclause 6.4.1. TNs 0, 2, 4, and 6 shall support channel combination xiii).
- xiv) For the secondary COMPACT carrier(s) carrying CPCCCH, timeslot numbers (TN) 1, 3, 5, and 7 shall support channel combination xxiii) in subclause 6.4.1. TNs 0, 2, 4, and 6 shall support channel combination xiii). CPCCCHs on secondary COMPACT carrier(s) shall be allocated on same time group as for primary COMPACT carrier.
- xv) For the secondary COMPACT carrier(s) not carrying CPCCCH, timeslot numbers (TN) 0 through 7 shall support channel combination xiii) in subclause 6.4.1.
- xvi) For COMPACT, BS\_PAG\_BLKs\_RES shall be less than or equal to 8 and less than or equal to 10-BS\_PBCCH\_BLKs.
- xvii) For COMPACT, CFCCH, CSCH, CPBCCH, and CPCCCH are rotated as described in subclause 6.3.2.1. PDTCH, PACCH, and PTCCH do not rotate.
- xviii) For COMPACT, the parameters NIB\_CCCH\_0, NIB\_CCCH\_1, NIB\_CCCH\_2, and NIB\_CCCH\_3 shall not be broadcast for a serving time group.
- xix) For the COMPACT, NIB\_CCCH\_0, NIB\_CCCH\_1, NIB\_CCCH\_2, and NIB\_CCCH\_3 blocks shall be idle for non-serving time groups and rotate in accordance with the non-serving time groups.

The downlink position of the NIB\_CCCH idle blocks is based on the ordered list as defined in subclause 6.3.2.1. The MS shall ignore these downlink idle blocks and shall interpret this action as not having detected an assigned USF value on an assigned PDCH.

- xx) For COMPACT large cells, NIB\_CCCH\_0, NIB\_CCCH\_1, NIB\_CCCH\_2, and NIB\_CCCH\_3 blocks shall be idle on timeslots immediately preceding and succeeding non-serving time groups and rotate in accordance with the non-serving time groups. The MS shall ignore these downlink idle blocks and shall interpret this action as not having detected an assigned USF value on an assigned PDCH.

The downlink position of the NIB\_CCCH idle blocks is based on the ordered list as defined in subclause 6.3.2.1.

- xxi) For COMPACT, the MS attempts uplink random access on its designated serving time group (TG) by monitoring for USF=FREE in every downlink block.

For dynamic allocation, while in the uplink transfer state, the MS monitors all of the downlink non-idle blocks of its assigned PDCH for uplink assignments. The MS shall ignore downlink idle blocks and shall interpret this action as not having detected an assigned USF value on an assigned PDCH.

USF should be set equal to FREE for downlink non-idle blocks B0 on timeslot numbers (TN) 1, 3, 5, and 7.

- xxii) While in broadcast/multicast receive mode (see 3GPP TS 45.008), the MS shall continue to monitor system information either on the BCCH or, if present, on the PBCCH unless the network has indicated that system information and paging messages are sent on the PACCH for the MBMS radio bearer the MS listens to. If the network has not indicated that system information and paging messages are sent on the PACCH, or if the MS does not have an MS\_ID, the MS shall additionally read paging messages either from the CCCH or, if the PBCCH is present, from the PCCCH. The MS shall then monitor the same paging group as in packet idle mode, i.e. shall determine the paging blocks to monitor using the methods described in subclause 6.5.2 or subclause 6.5.6. If the location of the MBMS radio bearer with respect to the control channels does not allow the mobile station to satisfy this requirement, the mobile station shall not read those radio blocks of the MBMS radio bearer that would prevent the monitoring of its paging group on the paging channel(s).

## 6.5.2 Determination of CCCH\_GROUP and PAGING\_GROUP for MS in idle mode

$$\text{CCCH\_GROUP} (0 \dots \text{BS\_CC\_CHANS}-1) = ((\text{IMSI mod } 1000) \text{ mod } (\text{BS\_CC\_CHANS} \times N)) \text{ div } N$$

$$\text{PAGING\_GROUP} (0 \dots N-1) = ((\text{IMSI mod } 1000) \text{ mod } (\text{BS\_CC\_CHANS} \times N)) \text{ mod } N$$

where

$N$  = number of paging blocks "available" on one CCCH = (number of paging blocks "available" in a 51-multiframe on one CCCH)  $\times$  BS\_PA\_MFRMS.

IMSI = International Mobile Subscriber Identity, as defined in 3GPP TS 23.003.

mod = Modulo.

div = Integer division.

### 6.5.3 Determination of specific paging multiframe and paging block index

The required 51-multiframe occurs when:

$$\text{PAGING\_GROUP div } (N \text{ div } \text{BS\_PA\_MFRMS}) = (\text{FN div } 51) \text{ mod } (\text{BS\_PA\_MFRMS})$$

The index to the required paging block of the "available" blocks in the 51-multiframe:

$$\text{Paging block index} = \text{PAGING\_GROUP mod } (N \text{ div } \text{BS\_PA\_MFRMS})$$

where the index is then used with the look-up table 5 of clause 7 to determine the actual paging channel interleaved block to be monitored.

In GPRS non-DRX mode, the MS shall listen to all blocks of the CCCH channel.

### 6.5.4 Short Message Service Cell Broadcast (SMSCB)

When a short message service cell broadcast (SMSCB) message is to be sent, the message shall be sent on one of the two cell broadcast channels (CBCH): the basic and the extended cell broadcast channel in four consecutive multiframe using the block defined in table 3 of clause 7. The multiframe used for the basic cell broadcast channel shall be those in which TB = 0,1,2 and 3. The multiframe used for the extended cell broadcast channel shall be those in which TB = 4, 5, 6 and 7 where:

$$\text{TB} = (\text{FN DIV } 51) \text{ mod } (8)$$

The SMSCB header shall be sent in the multiframe in which TB = 0 for the basic, and TB = 4 for the extended cell broadcast channel. When SMSCB is in use, this is indicated within the BCCH data (see 3GPP TS 44.018), and the parameter BS\_AG\_BLKS\_RES shall be set to one or greater. When the CBCH is mapped onto a CCCH+SDCCH/4 channel, use of SMSCB does not place any constraint on the value of BS\_AG\_BLKS\_RES.

NOTE 1: The MS reading of the extended CBCH is occasionally interrupted by MS idle mode procedures.

NOTE 2: For a certain network configuration the MS reading of the primary CBCH is occasionally interrupted by MS idle mode procedures when the MS is GPRS attached and in packet idle mode.

### 6.5.5 Voice group and voice broadcast call notifications

When mobile stations are to be alerted on a voice group or voice broadcast call, notification messages shall be sent on the notification channel (NCH), using the blocks defined in subclause 6.5.1.

When the NCH is in use, the parameter BS\_AG\_BLKS\_RES shall be set to a value not lower than the number of blocks used for the NCH, see subclause 6.5.1 vii).

### 6.5.6 Determination of PCCCH\_GROUP and PAGING\_GROUP for MS in GPRS attached mode

If PCCCH is present, then it shall be used in the GPRS attached mode for paging and access. It shall also be used by an MS performing the GPRS attach procedure for access and monitoring of network response. In absence of PCCCH, CCCH shall be used for paging and access. If the determination of the specific paging multiframe and paging block index as specified in this subclause is not supported on CCCH by both the MS and the BTS, the method defined in subclause 6.5.2 and 6.5.3 shall be used. This is negotiated at GPRS attach.

$$\text{PCCCH\_GROUP } (0 \dots \text{KC}-1) = ((\text{IMSI mod } 1000) \text{ mod } (\text{KC} * N)) \text{ div } N$$

$$\text{PAGING\_GROUP} (0 \dots M-1) = ( ( (\text{IMSI mod } 1000) \text{ div}(\text{KC} * \text{N}) ) * \text{N} + \\ (\text{IMSI mod } 1000) \text{ mod } \text{N} + \\ \text{Max}((m * \text{M}) \text{ div } \text{SPLIT\_PG\_CYCLE}, m)) \text{ mod } \text{M} \\ \text{for } m = 0, \dots, \text{Min}(\text{M}, \text{SPLIT\_PG\_CYCLE}) - 1$$

where

KC = number of (P)CCCH in the cell =

BS\_PCC\_CHANS for PCCCH  
BS\_CC\_CHANS for CCCH

M = number of paging blocks "available" on one (P)CCCH =  
(12 - BS\_PAG\_BLK\_RES - BS\_PBCCH\_BLK) \* 64 for PCCCH  
(9 - BS\_AG\_BLK\_RES) \* 64 for CCCH not combined  
(3 - BS\_AG\_BLK\_RES) \* 64 for CCCH + SDCCH combined

N =

1 for PCCCH

(9 - BS\_AG\_BLK\_RES) \* BS\_PA\_MFRMS for CCCH not combined  
(3 - BS\_AG\_BLK\_RES) \* BS\_PA\_MFRMS for CCCH/SDCCH combined

SPLIT\_PG\_CYCLE is an MS specific parameter negotiated at GPRS attach (see 3GPP TS 44.060)

IMSI = International Mobile Subscriber Identity, as defined in 3GPP TS 23.003.

mod = Modulo.

div = Integer division.

The MS shall receive paging and perform access on a single (P)CCCH identified by the PCCCH\_GROUP parameter (see subclause 6.5.1).

In non-DRX mode, depending whether there is or not PCCCH channel(s) in the cell, the MS shall listen :

- to all M blocks per multiframe where paging may appear on a PCCCH channel, or
- to all blocks on a CCCH channel.

In DRX mode, the MS shall listen to the blocks corresponding to its paging group as defined by the different PAGING\_GROUP values.

The required multiframe occurs when:

$$\text{PAGING\_GROUP} \text{ div} (\text{M} \text{ div } 64) = (\text{FN} \text{ div } \text{MFL}) \text{ mod } 64$$

where

MFL = multiframe length = 51 for CCCH or 52 for PCCCH

The index to the required paging block of the "available" blocks in the multiframe:

$$\text{Paging block index} = \text{PAGING\_GROUP} \text{ mod} (\text{M} \text{ div } 64)$$

where the index is then used with look-up tables of clause 7 to determine the actual PPCH block to be monitored. Table 5 is used for CCCH and table 7 for PCCCH.

For CCCH, if SPLIT\_PG\_CYCLE > 32 is negotiated, SPLIT\_PG\_CYCLE = 32 shall be used, in order to provide the MS enough time for BSIC and System Information decoding.

NOTE: On BCCH, the operator should limit DRX\_TIMER\_MAX (see 3GPP TS 44.060) to 4 seconds of the same reason.

### 6.5.7 Determination of CTS\_PAGING\_GROUP and specific paging 52-multiframe for MS in CTS mode

$CTS\_PAGING\_GROUP = (CTS-MSI \bmod N)$

where:

CTS-MSI = CTS Mobile Subscriber Identity as defined in 3GPP TS 23.003

N = number of CTS paging groups defined in the CTS-FP and given to the CTS-MS during the attachment procedure (see 3GPP TS 44.056).

The required 52-multiframe where a paging message may be sent to the CTS-MS occurs when:

$(FN \text{ div } 52) \bmod N = CTS\_PAGING\_GROUP$

## 7 Mapping tables

---

## 8 Flexible layer one

### 8.1 General

With FLO, the physical layer offers transport channels to upper layers. In each direction, one or several transport channels can be processed and multiplexed together by the same coding and multiplexing unit. The detailed functions of the coding and multiplexing unit are defined in 3GPP TS 45.003.

### 8.2 Transport channels

The offered transport channels are Dedicated CHannels (DCHs). DCHs are unidirectional and used to carry user or control data on DBPSCH. Depending on the channel mode of the DBPSCH on which they are used, two general forms of DCH are defined:

- i) Full rate DCH (DCH/F). This channel carries information at a maximum gross rate of 68.5 kbit/s and shall only be used on DBPSCH/F.
- ii) Half rate DCH (DCH/H). This channel carries information at a maximum gross rate of 34.1 kbit/s and shall only be used on DBPSCH/H.

### 8.3 Mapping of transport channels onto physical channels

#### 8.3.1 General

The detailed mapping of transport channels onto physical channels is defined in the following sections. Subclause 8.3.2 defines the mapping from TDMA frame number (FN) to radio frequency channel (RFCH). Subclause 8.3.3 defines the mapping of the physical channel onto TDMA frame number. Subclause 8.3.4 lists the permitted channel combinations and subclause 8.3.5 defines the multislot configurations.

#### 8.3.2 Mapping in frequency of transport channels onto physical channels

The mapping from TDMA frame number (FN) to radio frequency channel (RFCH) is done as specified in subclause 6.2.

#### 8.3.3 Mapping in time of transport channels onto physical channels

For each DBPSCH using FLO, every transmission time interval (TTI), one or several DCHs are processed and multiplexed together by the same coding and multiplexing unit. The single output data block from the coding and multiplexing unit is called a radio packet and it shall be mapped onto one and only one DBPSCH. The radio packet is then interleaved on bursts according to the channel mode and interleaving scheme chosen by layer 3 (see 3GPP TR 45.902 and 3GPP TS 44.118).

The mapping in time of radio packets is defined in table 8.3.3 below where the columns headed:

- i) 'DBPSCH configuration' defines the configuration of the DBPSCH in terms of channel mode (full rate or half rate) and interleaving scheme (4 bursts rectangular, 8 bursts diagonal or 4 bursts diagonal).
- ii) 'Sub-channel number' identifies the particular sub-channel being defined where a DBPSCH supports more than one channel of this type.
- iii) 'Direction' defines whether the mapping given applies identically to downlink and uplink (D&U), or to downlink (D) or uplink (U) only.
- iv) 'Allowable timeslots assignments' defines whether FLO can be supported on, or assigned to, any of the timeslots, or only on specific timeslots.
- v) 'Allowable RF channel assignments' defines whether FLO can use any or all of the radio frequency channels in the cell allocation (CA), or only the BCCH carrier (C0). It should be noted that any allocated channel Cx

within CA could be any radio frequency channel, and that no ordering of radio frequency channel number is implied. For example, allocated channel C0 need not have the lowest radio frequency channel number of the allocation.

- vi) 'Burst type' defines which type of burst as defined in clause 5.2 is to be used for the physical channel.
- vii) 'Repeat length in TDMA frames' defines how many TDMA frames occur before the mapping for the interleaved radio packets repeats itself.
- viii) 'Interleaved radio packet TDMA frame mapping' defines, within the parentheses, the TDMA frames used by each interleaved radio packet (e.g. 0..3). The numbers given equate to the TDMA frame number (FN) modulo the number of TDMA frames per repeat length; Therefore, the frame is utilized when:

TDMA frame mapping number = (FN)mod (repeat length)

Where there is more than one radio packet shown, each radio packet is given a separate designation e.g. B0, B1. Where diagonal interleaving is employed then all of the TDMA frames included in the radio packet are given, and hence the same TDMA frame number can appear more than once (see 3GPP TS 45.003).

Table 8.3.3: Mapping of radio packets onto physical channels

DBPSCH Configuration	Sub-channel number	Direction	Allowable time slot assignments	Allowable RF channel assignments	Burst type	Repeat length in TDMA frames	Interleaved radio packet TDMA frame mapping
full rate channel (DBPSCH/F) 8 bursts diagonal interleaving		D&U	0 ... 7	C0 ... Cn	NB <sup>1</sup>	13	B0(0...7), B1(4...11), B2(8...11,0...3)
full rate channel (DBPSCH/F) 4 bursts rectangular interleaving		D&U	0 ... 7	C0 ... Cn	NB <sup>1</sup>	13	B0(0...3), B2(4...7), B3(8...11)
half rate channel (DBPSCH/H) 4 bursts diagonal interleaving	0 1	D&U	0 ... 7	C0 ... Cn	NB <sup>1</sup>	13	B0(0,2,4,6), B1(4,6,8,10), B2(8,10,0,2) B0(1,3,5,7), B1(5,7,9,11), B2(9,11,1,3)

NOTE 1: An Access Burst (AB) is used on the uplink during handover.

### 8.3.4 Permitted channel combinations onto a basic physical subchannel

Four principles regulate the channel combinations with FLO:

- DCHs shall only be mapped on DBPSCH.
- On the same DBPSCH, a maximum of 8 DCHs may be allocated.
- In the same radio packet, a maximum of 4 DCHs may be processed and multiplexed together by the coding and multiplexing unit.
- With the exception of the SACCH, logical channels and transport channels shall not be mapped onto the same DBPSCH.

The following are the permitted ways in which channels can be combined onto one DBPSCH/F for one MS:

- f1) DCH/F(s) + SACCH/TF
- f2) DCH/F(s) + SACCH/M
- f3) DCH/F(s) + SACCH/MD
- f4) DCH/F(s) + SACCH/TPF + EPCCH/F
- f5) DCH/F(s) + SACCH/MP + EPCCH/M
- f6) DCH/F(s) + SACCH/MPD + EPCCH/MD

NOTE 1: the number of DCHs may be different in uplink and downlink.

NOTE 2: Combinations f2) and f3) are used without EPC in multislot configurations as defined in subclause 8.3.5.

NOTE 3: Combinations f5) and f6) are used with EPC in multislot configurations as defined in subclause 8.3.5.

The following definitions are used in the list of half rate combinations below.

<u>Combination designation</u>	<u>Channel combination</u>
SUB_FA	DCH/H(s) + SACCH/TH
SUB_FE	DCH/H(s) + SACCH/TPH + EPCCH/H

The following are the permitted ways in which channels can be combined onto one basic physical channel for two MSs on two DBPSCH/H:

- g1) SUB\_FA + SUB\_FA
- g2) SUB\_FA + SUB\_FE
- g3) SUB\_FE + SUB\_FE
- g4) SUB\_TA + SUB\_FA
- g5) SUB\_TA + SUB\_FE
- g6) SUB\_TE + SUB\_FA
- g7) SUB\_TE + SUB\_FE
- g8) SUB\_OTA + SUB\_FA
- g9) SUB\_OTA + SUB\_FE

g10) SUB\_OTE + SUB\_FA

g11) SUB\_OTE + SUB\_FE

## 8.3.5 Multislot configurations

### 8.3.5.1 Multislot configurations for DBPSCHs assigned

A multislot configuration consists of multiple DBPSCH/F assigned to the same MS. The multislot configuration occupies up to 8 basic physical channels, with different timeslots numbers (TN) but with the same frequency parameters (ARFCN or MA, MAIO and HSN) and the same training sequence (TSC).

Two types of multislot configurations exist, symmetric and asymmetric. The symmetric case consists of only bi-directional channels. The asymmetric case consists of both bi-directional and unidirectional downlink channels.

The occupied physical channels shall consist of the following channel combinations as defined in subclause 8.3.4.

x channels of type f2) +

y channels of type f3)

When in EPC mode (see 3GPP TS 45.008) the occupied physical channels shall consist of the following channel combinations as defined in subclause 8.3.4.

x channels of type f5) +

y channels of type f6)

where  $1 \leq x \leq 8, y = 0$  for symmetric multislot configuration

$1 \leq x \leq 7, 1 \leq y \leq 7, x+y \leq 8$  for asymmetric multislot configuration

The assignment of channels to a Multislot Configuration must always consider the multislot capability of the MS, as defined by the multislot class described in annex B.

### 8.3.5.2 Multislot configurations for dual transfer mode in lu mode

The multislot configuration for dual transfer mode in *lu mode* is the same as in 6.4.2.7. The only difference is that FLO is used on the assigned DBPSCHs.

## Annex A (normative): Phase 2 mobiles in a Phase 1 infrastructure

### A.1 Scope

Phase 2 mobiles are required to behave properly in a Phase 1 networks, when downlink DTX is used in conjunction with frequency hopping.

### A.2 Implementation options for TCH channels

#### A.2.1 C0 filling on the TCH

When the TCH is active, and no associated traffic frame is scheduled for transmission, the following options apply for filling the burst on the C0 radio frequency channel.

A.2.1.1 A dummy burst with (BN61, BN62, BN86) = training sequence bits of normal bursts

A.2.1.2 A dummy burst with the "C0 filling training sequence

(BN61, BN62, BN86) = (0,1,1,1,0,0,0,1,0,1,1,1,0,0,0,1,0,1,1,1,0,0,0,1,0,1).

A.2.1.3 A dummy burst with ( BN61, BN62, BN86) mapped from the TSC bits of normal bursts according to the table

TSC for other bursts on TCH	Dummy bursts (BN61, BN62 BN86)	Corresponding TSC
0	(0,1,0,0,0,0,1,1,1,0,1,1,1,0,1,0,0,1,0,0,0,0,1,1,1,0)	2
1	(0,1,0,0,1,1,1,0,1,0,1,1,0,0,0,0,0,1,0,0,1,1,1,0,1,0)	5
2	(0,0,1,0,0,1,0,1,1,1,0,0,0,0,1,0,0,0,1,0,0,1,0,1,1,1)	0
3	(0,0,0,1,1,0,1,0,1,1,1,0,0,1,0,0,0,0,0,1,1,0,1,0,1,1)	4
4	(0,1,0,0,1,1,1,0,1,0,1,1,0,0,0,0,0,1,0,0,1,1,1,0,1,0)	5
5	(0,1,0,0,0,0,1,1,1,0,1,1,1,0,1,0,0,1,0,0,0,0,1,1,1,0)	2
6	(0,1,0,0,0,1,1,1,1,0,1,1,0,1,0,0,0,1,0,0,0,1,1,1,1,0)	3
7	(0,1,0,0,1,1,1,0,1,0,1,1,0,0,0,0,0,1,0,0,1,1,1,0,1,0)	5

#### A.2.1.4 Partial SID information

The BTS transmits bursts containing parts of the SID frames provided by the speech encoder. The bits transmitted in such bursts on C0 carrier contain the same bits that would have been transmitted in those bursts in those if the associated traffic frames were scheduled for transmission.

### A.2.2 Half burst filling

For downlink DTX, when a given traffic frame is scheduled for transmission and one of its adjacent traffic frames is not scheduled for transmission, half of the "encrypted bits" belonging to the normal bursts associated with the scheduled traffic frame need to be filled. These bits are referred to as "half burst filling bits". These half bursts filling bits contain either.

A.2.2.1 Partial SID information from any associated SID frame; or

A.2.2.2 The mixed bits of the dummy bursts (encrypted or not encrypted)

## A.2.3 Dummy burst Stealing flag

The dummy burst stealing flag are set to either 1 or 0.

## A.2.4 Half burst Filling Stealing flag

BN60 or BN87 corresponding to the "encrypted bits" of a filled half burst, defined as the "half burst filling stealing flag", are jointly set to a value of either 1 or 0.

## A.2.5 Allowed combinations

Table A.2.5.1 below provides the allowed combinations for phase 1 networks supporting downlink DTX in conjunction with frequency hopping.

**Table A.2.5.1: Possible combinations for networks supporting downlink DT in conjunction with frequency hopping**

Combination	C0 filling on the TCH	Half Burst filling	Dummy Bursts Stealing Flag	Half Burst Filling Stealing Flag
1	Dummy bursts with (BN61-BN86) equal to the bits of the TSC of the other normal bursts (A 2.1.1)	not defined	0	0
2	Dummy burst with "C0 filling training sequence" (A 2.1.2)	Partial SID information (A 2.2.1)	0	0
3	Dummy burst with (BN61, BN62....BN86) mapped from the TSC bits of normal bursts (A 2.1.3)	Partial SID information (A 2.2.1)	0	0
4	Partial SID information (A 2.1.4)	Partial SID information (A 2.2.1)	1	1
5	Dummy burst with "C0 filling training sequence" (A 2.1.2)	Dummy burst mixed bits (A 2.2.2)	1	1
6 (for DCS 1 800 only)	Partial SID information (A 2.1.4)	Partial SID information (A 2.2.1)	0	0

## A.3 Idle Channels

When a channel is idle, a dummy burst may be transmitted on C0 frequency channel with any options described in subclauses A 2.1.1, A 2.1.2, A 2.1.3.

## Annex B (normative): Multislot capability

### B.1 MS classes for multislot capability

When an MS supports the use of multiple timeslots it shall belong to a multislot class as defined below:

Table B.1

Multislot class	Maximum number of slots			Minimum number of slots				Type
	Rx	Tx	Sum	T <sub>ta</sub>	T <sub>tb</sub>	T <sub>ra</sub>	T <sub>rb</sub>	
1	1	1	2	3	2	4	2	1
2	2	1	3	3	2	3	1	1
3	2	2	3	3	2	3	1	1
4	3	1	4	3	1	3	1	1
5	2	2	4	3	1	3	1	1
6	3	2	4	3	1	3	1	1
7	3	3	4	3	1	3	1	1
8	4	1	5	3	1	2	1	1
9	3	2	5	3	1	2	1	1
10	4	2	5	3	1	2	1	1
11	4	3	5	3	1	2	1	1
12	4	4	5	2	1	2	1	1
13	3	3	NA	NA	a)	3	a)	2
14	4	4	NA	NA	a)	3	a)	2
15	5	5	NA	NA	a)	3	a)	2
16	6	6	NA	NA	a)	2	a)	2
17	7	7	NA	NA	a)	1	0	2
18	8	8	NA	NA	0	0	0	2
19	6	2	NA	3	b)	2	c)	1
20	6	3	NA	3	b)	2	c)	1
21	6	4	NA	3	b)	2	c)	1
22	6	4	NA	2	b)	2	c)	1
23	6	6	NA	2	b)	2	c)	1
24	8	2	NA	3	b)	2	c)	1
25	8	3	NA	3	b)	2	c)	1
26	8	4	NA	3	b)	2	c)	1
27	8	4	NA	2	b)	2	c)	1
28	8	6	NA	2	b)	2	c)	1
29	8	8	NA	2	b)	2	c)	1
30	5	1	6	2	1	1	1	1
31	5	2	6	2	1	1	1	1
32	5	3	6	2	1	1	1	1
33	5	4	6	2	1	1	1	1
34	5	5	6	2	1	1	1	1
35	5	1	6	2	1	1+to	1	1
36	5	2	6	2	1	1+to	1	1
37	5	3	6	2	1	1+to	1	1
38	5	4	6	2	1	1+to	1	1
39	5	5	6	2	1	1+to	1	1
40	6	1	7	1	1	1	to	1
41	6	2	7	1	1	1	to	1
42	6	3	7	1	1	1	to	1
43	6	4	7	1	1	1	to	1
44	6	5	7	1	1	1	to	1
45	6	6	7	1	1	1	to	1

a) = 1 with frequency hopping.

- = 0 without frequency hopping.
- b) = 1 with frequency hopping or change from Rx to Tx.  
= 0 without frequency hopping and no change from Rx to Tx.
- c) = 1 with frequency hopping or change from Tx to Rx.  
= 0 without frequency hopping and no change from Tx to Rx.
- to = 31 symbol periods (this can be provided by a TA offset, i.e. a minimum TA value).

Type 1 MS are not required to transmit and receive at the same time.

Type 2 MS are required to be able to transmit and receive at the same time.

For HSCSD, only multislot classes 1 - 18 are recognised. An MS with a higher multislot class number shall indicate a suitable multislot class less than 19 for HSCSD applications (see 3GPP TS 44.018).

#### **Rx:**

Rx describes the maximum number of receive timeslots that the MS can use per TDMA frame. The MS must be able to support all integer values of receive TS from 0 to Rx (depending on the services supported by the MS). The receive TS need not be contiguous. For type 1 MS, the receive TS shall be assigned within window of size Rx, and no transmit TS shall occur between receive TS within a TDMA frame.

#### **Tx:**

Tx describes the maximum number of transmit timeslots that the MS can use per TDMA frame. The MS must be able to support all integer values of transmit TS from 0 to Tx (depending on the services supported by the MS). The transmit TS need not be contiguous. For type 1 MS, the transmit TS shall be assigned within window of size Tx, and no receive TS shall occur between transmit TS within a TDMA frame.

#### **Sum:**

Sum is the total number of uplink (u) and downlink (d) TS that can actually be used by the MS per TDMA frame. The MS must be able to support all combinations of integer values of  $d \leq Rx$  and  $u \leq Tx$  TS where  $1 \leq d + u \leq Sum$  (depending on the services supported by the MS). Sum is not applicable to all classes.

#### **T<sub>ta</sub>:**

T<sub>ta</sub> relates to the time needed for the MS to perform adjacent cell signal level measurement and get ready to transmit.

For type 1 MS it is the minimum number of timeslots that will be allowed between the end of the previous transmit or receive TS and the next transmit TS when measurement is to be performed between. It should be noted that, in practice, the minimum time allowed may be reduced by amount of timing advance.

For type 1 MS that supports extended TA, the parameter T<sub>ta</sub> is increased by 1 if TA > 63 and there is a change from RX to TX.

For type 2 MS it is not applicable.

For circuit switched multislot configurations as defined in subclause 6.4.2.1, T<sub>ta</sub> is not applicable.

#### **T<sub>tb</sub>:**

T<sub>tb</sub> relates to the time needed for the MS to get ready to transmit. This minimum requirement will only be used when adjacent cell power measurements are not required by the service selected.

For type 1 MS it is the minimum number of timeslots that will be allowed between the end of the last previous receive TS and the first next transmit TS or between the previous transmit TS and the next transmit TS when the frequency is changed in between. It should be noted that, in practice, the minimum time allowed may be reduced by the amount of the timing advance.

For type 1 MS that supports extended TA, the parameter T<sub>tb</sub> = 2 if TA > 63 and there is a change from RX to TX.

For type 2 MS it is the minimum number of timeslots that will be allowed between the end of the last transmit burst in a TDMA frame and the first transmit burst in the next TDMA frame.

**$T_{ra}$ :**

$T_{ra}$  relates to the time needed for the MS to perform adjacent cell signal level measurement and get ready to receive.

For type 1 MS it is the minimum number of timeslots that will be allowed between the previous transmit or receive TS and the next receive TS when measurement is to be performed between.

For type 2 MS it is the minimum number of timeslots that will be allowed between the end of the last receive burst in a TDMA frame and the first receive burst in the next TDMA frame.

An MS, except for multislot class 30 – 45, shall be able to decode SCH from a neighbour cell, independent of its relative timing, using an idle frame in combination with  $T_{ra}$  from the preceding frame.

 **$T_{rb}$ :**

$T_{rb}$  relates to the time needed for the MS to get ready to receive. This minimum requirement will only be used when adjacent cell power measurements are not required by the service selected.

For type 1 MS it is the minimum number of timeslots that will be allowed between the previous transmit TS and the next receive TS or between the previous receive TS and the next receive TS when the frequency is changed in between.

For type 2 MS it is the minimum number of timeslots that will be allowed between the end of the last receive burst in a TDMA frame and the first receive burst in the next TDMA frame.

---

## B.2 Constraints imposed by the service selected

The service selected will impose certain restrictions on the allowed combinations of transmit and receive timeslots. Such restrictions are not imposed by this annex but should be derived from the description of the services. For example, in the case of circuit switched data the TS numbers used in the uplink will be a subset of those used in the downlink.

The service selected will determine whether or not adjacent cell power measurements are required and therefore whether  $T_{ra}$  or  $T_{rb}$  is allowed for.

---

## B.3 Network requirements for supporting MS multislot classes

The multislot class of the MS will limit the combinations and configurations allowed when supporting multislot communication.

GSM 400 network may support extended cell coverage utilising timing advance values greater than 63. This has an effect that the time for MS to change from RX to TX will be very short for distant MS. It is necessary for the network to decide whether requested or current multislot configuration can be supported by distant MS. If actual TA is great enough it may be necessary for network to downgrade requested resources or it may be necessary for network to downgrade current resources.

It is necessary for the network to decide whether the MS needs to perform adjacent cell power measurement for the type of multislot communication intended and whether the service imposes any other constraints before the full restrictions on TS assignments can be resolved. This is best shown by example:

For a multislot class 5 MS in circuit switched configuration (adjacent cell power measurements required) five basic configurations of channels are possible which can occur in six different positions in the TDMA frame. The service itself may determine that asymmetry must be downlink biased, in which case the last two solutions would not be allowed.

Figure B.1

For a multislot class 13 MS when adjacent cell power measurements are not required and the service does not constrain the transmit and receive timeslots to use the same timeslot number. Many configurations of channels are possible so long as the 5 constraints of the MS are catered for. [Currently services envisaged only allow for the last example here.]

There is no requirement for relative timing of Tx timeslots in relation to Rx timeslots

Many configurations are possible

This configuration could be used for HSCSD or GPRS

Figure B.2

## B.4 Multislot capabilities for dual carrier mobile stations

For mobile stations supporting downlink dual carrier, the multislot capability applicable to dual carrier operation is dependent on the (DTM) EGPRS (high) multislot class (see subclause B.1) and on the *Multislot Capability Reduction for Downlink Dual Carrier* field (see 3GPP TS 24.008) signalled by the mobile station as defined in Table B.2 . Only mobile stations of multislot classes listed in Table B.2 can support downlink dual carrier.

Table B.2

Signalled multislot class	Maximum Number of downlink timeslots	Equivalent multislot class when "Multislot Capability Reduction for Downlink Dual Carrier" IE indicates reduction of:	
		0 or 1 timeslots	2 or more timeslots
8	10	30	8
10	10	31	10
11	10	32	11
12	10	33	12
30	10	-	-
31	10	-	-
32	10	-	-
33	10	-	-
34	10	-	-
35	10	-	-
36	10	-	-
37	10	-	-
38	10	-	-
39	10	-	-
40	12	-	-
41	12	-	-
42	12	-	-
43	12	-	-
44	12	-	-
45	12	-	-

The values of Rx", Tx" and Sum" and Rx\_Sum apply for downlink dual carrier configurations.

Rx", Tx" and Sum" correspond to Rx, Tx and Sum for the Equivalent multislot class (see Table B.2) and the values of  $T_{ta}$ ,  $T_{tb}$ ,  $T_{ra}$  and  $T_{rb}$  of the equivalent multislot class shall then apply; if no equivalent multislot class is specified then Rx", Tx" and Sum" correspond to Rx, Tx and Sum respectively for the signalled multislot class and the switching times  $T_{ta}$ ,  $T_{tb}$ ,  $T_{ra}$  and  $T_{rb}$  of the signalled multislot class shall apply.

Possible switching and measurement timings for downlink dual carrier MSs that have a higher equivalent multislot class compared to the signalled multislot class are illustrated in Annex E.

Rx\_Sum is given by the Maximum Number of downlink timeslots as specified in Table B.2 minus the number of timeslots indicated in the *Multislot Capability Reduction for Downlink Dual Carrier* field (see 3GPP TS 24.008). If the resultant Rx\_Sum is lower than the value given by the field Sum in Table B.1 for the signalled multislot class (or the equivalent multislot class if different from signalled multislot class) (see Table B.2), then Rx\_Sum shall be assumed to be equal to Sum from Table B.1 for that multislot class.

NOTE: The Equivalent multislot class and corresponding switching times (where different from the signalled multislot class) apply only for dual carrier assignments. For assignments which use only one carrier, the signalled multislot class (and corresponding switching times as specified in Table B.1) apply.

#### Rx":

Rx" describes the maximum number of receive timeslots that the MS can use per radio frequency channel per TDMA frame. The MS must be able to support all integer values of receive TS from 0 to Rx" (depending on the services supported by the MS) on each radio frequency channel. The receive TS need not be contiguous. For type 1 MS, all the receive TS (on both radio frequency channels) shall be allocated within a window of size Rx", and no transmit TS shall occur between receive TS within a TDMA frame.

#### Tx":

Tx" describes the maximum number of transmit timeslots that the MS can use per TDMA frame. The MS must be able to support all integer values of transmit TS from 0 to Tx" (depending on the services supported by the MS). The transmit TS need not be contiguous. For type 1 MS, the transmit TS shall be allocated within window of size Tx", and no receive TS shall occur between transmit TS within a TDMA frame.

NOTE: All transmit timeslots are allocated on the same uplink radio frequency channel within a radio block period.

**Sum<sup>u</sup>:**

Sum<sup>u</sup> is the total number of uplink TS and downlink TS (on either radio frequency channel) that can be used by the MS per TDMA frame. The MS must be able to support all combinations of integer values of  $1 \leq d1 \leq Rx^u$ ,  $1 \leq d2 \leq Rx^d$  and  $u \leq Tx^u$  TS where  $1 \leq d1 + u \leq Sum^u$  and  $1 \leq d2 + u \leq Sum^u$  (depending on the services supported by the MS).

**Rx\_Sum:**

Rx\_Sum is the total number of downlink TS (on both radio frequency channels) that can be received by the MS per TDMA frame. The MS must be able to support all combinations of integer values of d1 and d2 where  $1 \leq d1 + d2 \leq Rx\_Sum$  (depending on the services supported by the MS).

NOTE: Both d1 and d2 need to be different from 0 in order for Sum<sup>u</sup> and Rx\_Sum to apply.

## Annex C (informative): CTSBCH Timeslot shifting example

With the following parameters :

- $TNI = 4$
- $TNSCN = 9$
- $TNSCO = 1$      i.e.  $(TNS1 = TNS_{9,1} = (0, 3, 7, 6, 5, 2, 4, 1))$  and  $TNS2 = TNS_{9,0} = (0, 1, 4, 5, 7, 3, 6, 2)$
- $x0 = 2$
- $x1 = 3$
- $x2 = 5$
- $x3 = 4$

and the timeslot shifting algorithm defined in section 6.3.3, the CTSBCH TN used in set 0 of the shifting sequence is :

$(FN \text{ div } 52) \bmod 51$	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	
TNS used	1	1	1	1	1	1	1	1	2	2	2	2	1	1	1	1	1	2	
CTSBCH TN	4	1	0	3	7	6	5	2	0	1	4	5	2	4	1	0	3	6	
$(FN \text{ div } 52) \bmod 51$	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35	
TNS used	2	2	1	1	2	2	2	2	2	2	2	2	1	1	1	1	1	1	
CTSBCH TN	2	0	3	7	3	6	2	0	1	4	5	7	6	5	2	4	1	0	
$(FN \text{ div } 52) \bmod 51$	36	37	38	39	40	41	42	43	44	45	46	47	48	49	50				
TNS used	2	2	2	2	2	1	1	1	2	2	2	2	1	1	1				
CTSBCH TN	1	4	5	7	3	7	6	5	7	3	6	2	4	1	0				

For the next sets, same mechanism applies, with

- set 1 beginning with CTSBCH TN = 3
- set 2 beginning with CTSBCH TN = 5
- set 3 beginning with CTSBCH TN = 1
- set 4 beginning with CTSBCH TN = 7
- set 5 beginning with CTSBCH TN = 2
- set 6 beginning with CTSBCH TN = 0
- set 7 beginning with CTSBCH TN = 6

---

## Annex D (informative): COMPACT multiframe structure examples

In the figures, the 52-multiframe number (MFN) shall have a range of 0 to 3 and can be calculated from the TDMA frame number (FN) as follows:

$$\text{MFN} = (\text{FN div } 52) \bmod 4$$

For COMPACT, timeslot mapping and rotation of the control channels is used such that control channels belonging to a serving time group are rotated over odd timeslot numbers as follows: 7, 5, 3, 1, 7, 5, ... . The rotation occurs between frame numbers  $(\text{FN}) \bmod 52 = 3$  and 4. The timeslot mapping and rotation of the control channels in this manner allows the mobile station to measure the received signal level from surrounding cells in its normal measurement window. Since the rotation repeats itself every 208 frames, the 52-multiframe number (MFN) allows the mobile station to determine its location in the time group rotation during selection and re-selection.

The following relates to Figures D.1 through D.7:

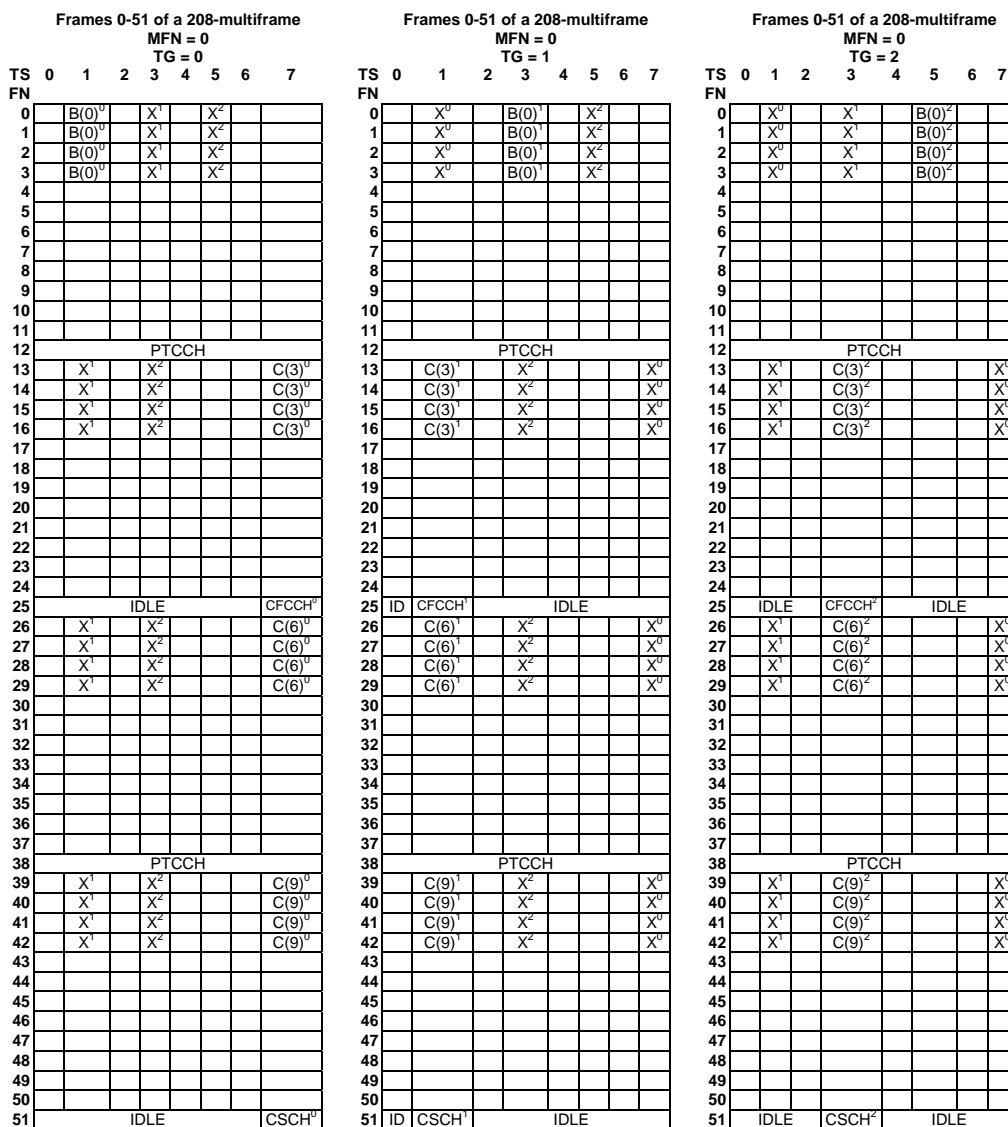

- i)  $B(x)^y$  = time group y uses CPBCCH in block x;
- ii)  $C(x)^y$  = time group y uses CPCCCH in block x;
- iii) PTCCH = PTCCH as normal;
- iv)  $\text{CFCCH}^y$  = time group y uses CFCCH;
- v)  $\text{CSCH}^y$  = time group y uses CSCH;
- vi) IDLE = idle burst;
- vii)  $X^y$  = block designated as idle for time group y;
- viii) Empty = used for traffic as normal.

**Figure D.1: COMPACT downlink 52-multiframe structure using 4 time groups for nominal cells (based on an assignment of 1 CPBCH and 3 CPCCCHs with NIB\_CCCH\_0 = NIB\_CCCH\_1 = NIB\_CCCH\_2 = NIB\_CCCH\_3 = 4). NIB\_CCCH is not broadcast for serving cell time group**

NOTE: For uplink 52-multiframe structure (based on an assignment of 16 prioritized CPRACHs, see subclause 6.3.2.2.3a), replace B( ) by R( ) where R( ) denotes CPRACH, move down one block, and rotate according to subclause 6.3.2.1. Replace C( ) by R( ) and move down one block. CPRACH in general can be mapped as PRACH in table 6 of clause 7.

**Figure D.2: COMPACT downlink 52-multiframe structure using 3 time groups for nominal cells (based on an assignment of 1 CPBCH and 3 CPCCCHs with NIB\_CCCH\_0 = NIB\_CCCH\_1 = NIB\_CCCH\_2 = 4, NIB\_CCCH\_3 = 0). NIB\_CCCHs not broadcast for serving cell time group**

NOTE: For uplink 52-multiframe structure (based on an assignment of 16 prioritized CPRACHs, see subclause 6.3.2.2.3a), replace B( ) by R( ) where R( ) denotes CPRACH, move down one block, and rotate according to subclause 6.3.2.1. Replace C( ) by R( ) and move down one block. CPRACH in general can be mapped as PRACH in table 6 of clause 7.

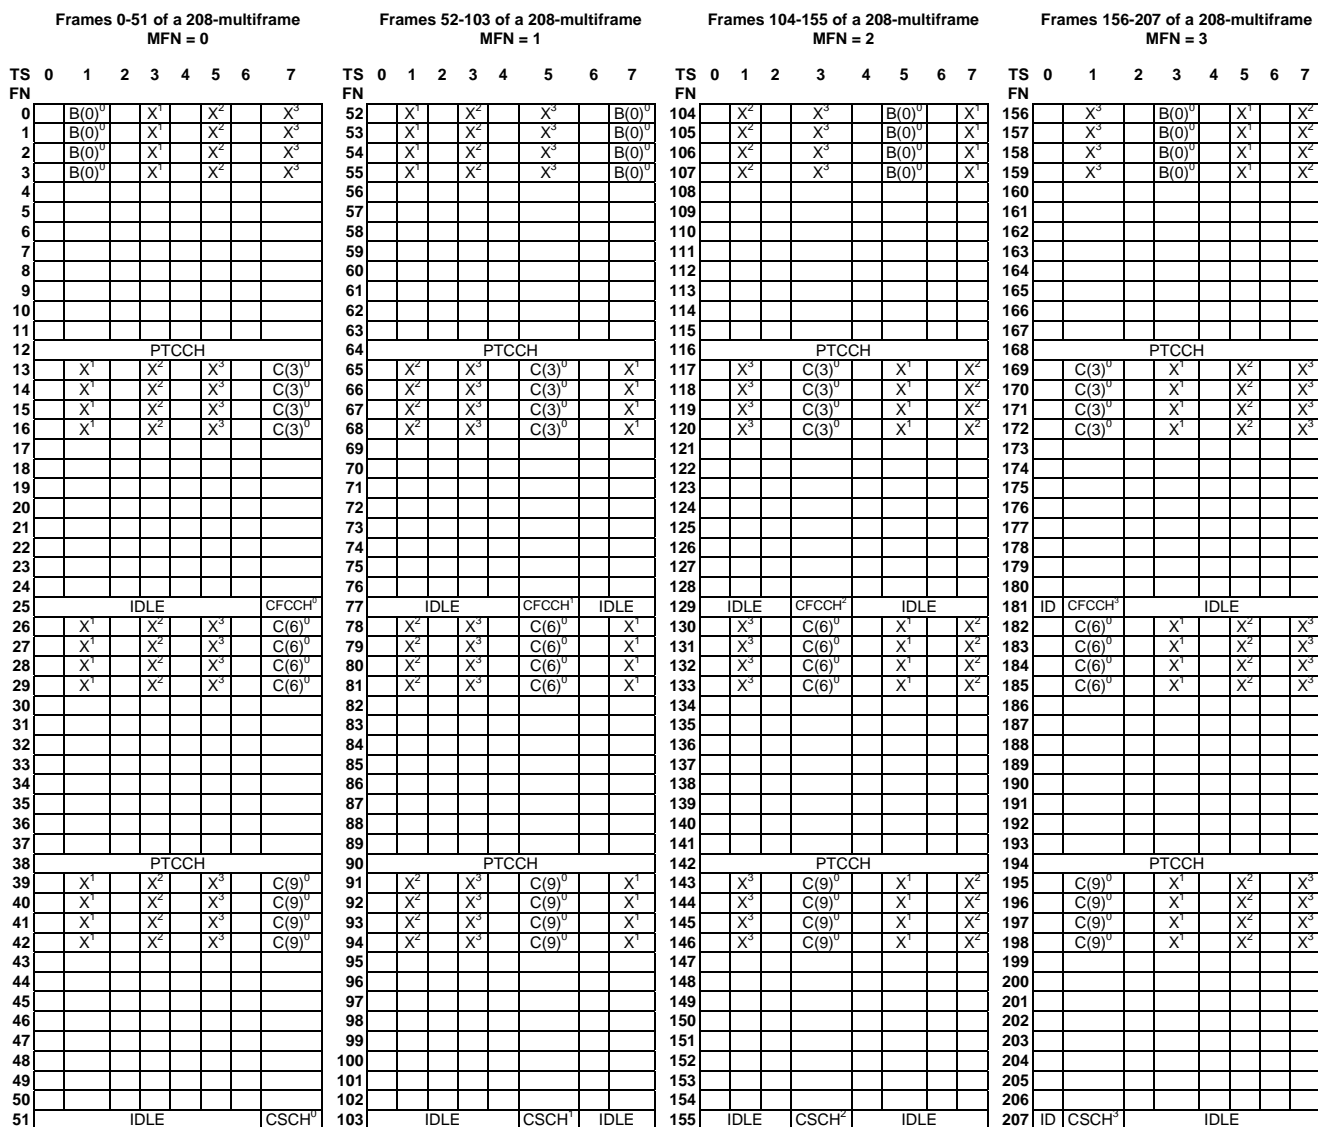

The figure shows four tables for time groups TG=0, TG=1, TG=2, and TG=3. Each table has 52 rows (TS 0 to 51) and 8 columns (TS 0 to 7). The content of the tables is as follows:

- TG=0:** Rows 0-3 contain B(0) and X(3) patterns. Rows 13-16 contain PTCCH and C(3) patterns. Rows 25-29 contain IDLE and C(6) patterns. Rows 38-42 contain PTCCH and C(9) patterns. Rows 50-51 are IDLE and CSCH.
- TG=1:** Rows 0-3 contain X(0) and B(0) patterns. Rows 13-16 contain PTCCH and C(3) patterns. Rows 25-29 contain ID, CFCCH, and IDLE patterns. Rows 38-42 contain PTCCH and C(9) patterns. Rows 50-51 are ID, CSCH, and IDLE patterns.
- TG=2:** Rows 0-3 contain X(0) and B(0) patterns. Rows 13-16 contain PTCCH and C(3) patterns. Rows 25-29 contain IDLE, CFCCH, and IDLE patterns. Rows 38-42 contain PTCCH and C(9) patterns. Rows 50-51 are IDLE, CSCH, and IDLE patterns.
- TG=3:** Rows 0-3 contain X(0) and B(0) patterns. Rows 13-16 contain PTCCH and C(3) patterns. Rows 25-29 contain IDLE, CFCCH, and IDLE patterns. Rows 38-42 contain PTCCH and C(9) patterns. Rows 50-51 are IDLE, CSCH, and IDLE patterns.

**Figure D.3: COMPACT downlink 52-multiframe structure using 4 time groups for large cells (based on an assignment of 1 CPBCCCH and 3 CPCCCHs with NIB\_CCCH\_0 = NIB\_CCCH\_1 = NIB\_CCCH\_2 = NIB\_CCCH\_3 = 4). NIB\_CCCH is not broadcast for serving cell time group**

NOTE: For uplink 52-multiframe structure (based on an assignment of 16 prioritized CPRACHs, see subclause 6.3.2.2.3a), replace B( ) by R( ) where R( ) denotes CPRACH, move down one block, and rotate according to subclause 6.3.2.1. Replace C( ) by R( ) and move down one block. CPRACH in general can be mapped as PRACH in table 6 of clause 7.

**Figure D.5: Example of COMPACT downlink timeslot mapping and rotation of control channels using 4 time groups for nominal cells (based on an assignment of 1 CPBCCH and 3 CPCCCHs with NIB\_CCCH\_0 = NIB\_CCCH\_1 = NIB\_CCCH\_2 = NIB\_CCCH\_3 = 4). TG = 0 is illustrated. NIB\_CCCH is not broadcast for serving cell time group**

NOTE: For uplink 52-multiframe structure (based on an assignment of 16 prioritized CPRACHs, see subclause 6.3.2.2.3a), replace B( ) by R( ) where R( ) denotes CPRACH, move down one block, and rotate according to subclause 6.3.2.1. Replace C( ) by R( ) and move down one block. CPRACH in general can be mapped as PRACH in table 6 of clause 7.

# Annex E (informative): Example illustrations of neighbour cell measurements for downlink dual carrier MS

Figure E.1 illustrates possible switching and measurement timings for downlink dual carrier MSs that have a higher equivalent multislots class compared to the signalled multislots class (see subclause B.4).

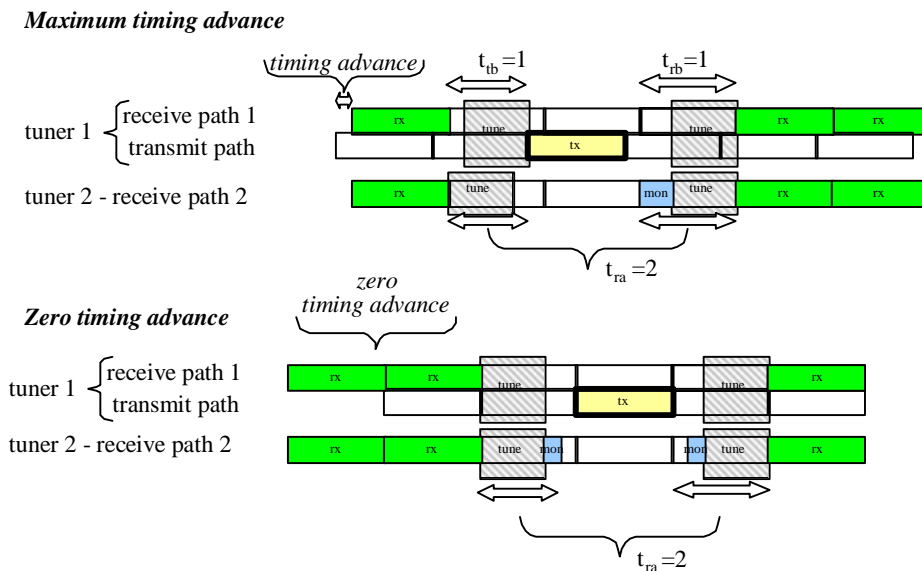

Figure E.1

2004-04	19	GP-040725	089		Correction to Figure 9	6.5.0	6.6.0
2004-11	22	GP-042752	090	1	Removal of PTM-M	6.6.0	6.7.0
2004-11	22	GP-042783	091	1	Introduction of MBMS	6.6.0	6.7.0
2005-01	23	GP-050094	092		Correction to mapping of uplink packet channel	6.7.0	6.8.0
2005-01	23	GP-050482	095	1	High multislot class operation on a 'd = 1, u = 4' allocation in a legacy network	6.7.0	6.8.0
2005-01	23	GP-050229	096		Provision of cell reselection parameters for neighbouring cells in the serving cell	6.7.0	6.8.0
2005-04	24	GP-051064	097	1	Extension of DTM to high multislot classes	6.8.0	6.9.0
2005-04	24	GP-050709	098		Clarification on non-contiguous assigned timeslots	6.8.0	6.9.0
2005-06	25	GP-051494	100		Corrections for reception of multiple MBMS sessions	6.9.0	6.10.0

2005-09	26	GP-052236	0102	1	Correction to multislot classes allowed for MBMS	6.10.0	6.11.0
2005-11	27	GP-052847	0103	1	MBMS transfer mode	6.11.0	6.12.0
2005-11	27	GP-052849	0106		Correction on the transmission of SI1	6.11.0	6.12.0
2006-04	29	GP-060921	0107	1	Correction of Title of Clause 7 and correspondings	6.12.0	7.0.0
2006-06	30	GP-061338	0108	1	Correction of terminology: "allocation" vs. "assignment"	7.0.0	7.1.0
2006-11	32	GP-062442	0113	3	Introduction of Downlink Dual Carrier	7.1.0	7.2.0
2007-02	33	GP-070368	0112	3	Flexible timeslot assignment	7.2.0	7.3.0
2007-02	33	GP-070465	0116	1	Clarification of multislot capabilities for non-DCDL assignments	7.2.0	7.3.0
2007-05	34	GP-070790	0118		Editorial corrections	7.3.0	7.4.0
2007-08	35	GP-071515	0117	5	Introduction of RTTI	7.4.0	7.5.0
2007-08	35	GP-071256	0121		Introduction of RED HOT and HUGE	7.4.0	7.5.0
2007-08	35	GP-071271	0122		Clarification on timeslot configurations for dual carrier in the downlink	7.4.0	7.5.0
